THE GAW MISSION

- Systematic long-term monitoring of atmospheric chemical and physical parameters globally
- Analysis and assessment
- **Development of predictive capability** (GURME and Sand and Dust Storm Warning System) and now for chemical weather (e.g. incl. **volcanic ash**)

Greg Carmichael, Chair GAW SSC, USA
 Oksana Tarasova, Chief AERD, WMO

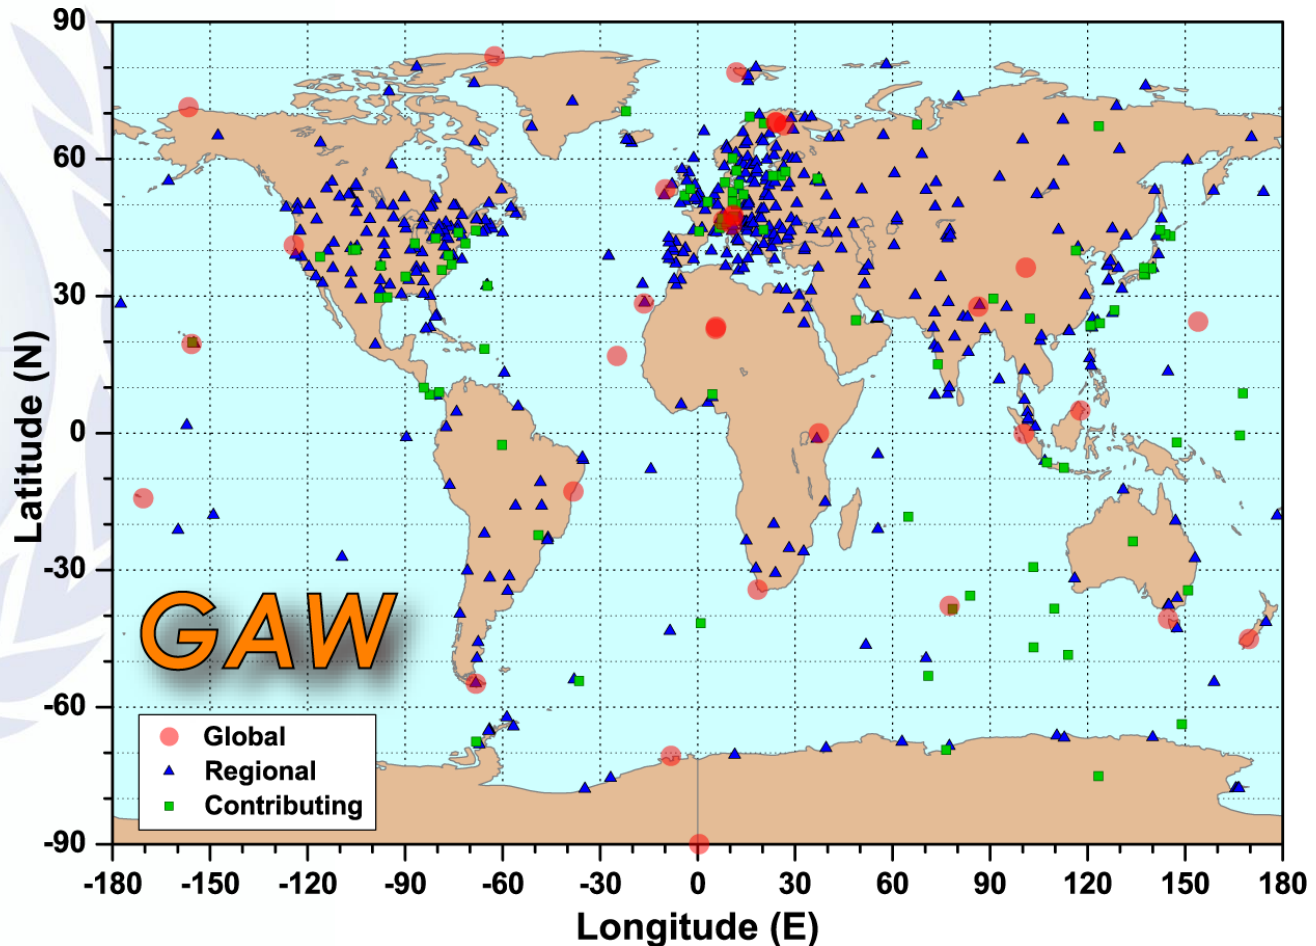

Overview of the Structure of GAW

- More than 100 countries have registered **more than 800 stations** with the GAW Station Information System (**GAWSIS**). Established 27 years ago.
- Various **GAW expert groups and central facilities** exist under the oversight of the WMO Commission for Atmospheric Sciences (CAS) and its Environmental Pollution and Atmospheric Chemistry Scientific Steering Committee (EPAC SSC)
- **8 Scientific Advisory Groups (SAGs)** to organise and co-ordinate GAW activities by parameter and application, and the Expert Team on World Data Centres (ET-WDC).
- 4 Quality Assurance/Science Activity Centres (QA/SACs) perform network-wide **data quality and science-related functions**.
- 35 Central Calibration Laboratories (CCLs) and World and Regional **Calibration Centres (WCCs, RCCs)** maintain calibration standards and provide instrument calibrations and **training** to the stations.
- **6 World Data Centres** archive the observational data and metadata, which are integrated by the GAW Station Information System (GAWSIS).
- **GAW Training (GAWTEC)**: More than 270 persons trained from 58 countries

GAW stations network

Versatile station information is available through the GAW Station Information System GAWSIS (<http://gaw.empa.ch/gawsis/>).

Aircraft and satellite measurements also contribute to the observations

GAW Aerosol Variables

- Column and profile
 - Multi-wavelength aerosol optical depth (AOD)
 - Vertical distribution of aerosol backscattering and extinction
- Chemical (in two size fractions)
 - Mass and major chemical components
- Optical coefficients at various wavelengths
 - Light scattering and hemispheric backscattering
 - Light absorption
- Physical
 - Number size distribution and total concentration
 - Cloud condensation nuclei number concentration at various super-saturations
- **GALION**: GAW Aerosol Lidar Observation Network (Lidars and Ceilometers)

Aerosol SAG Chair: Paolo Laj, CNRS, France

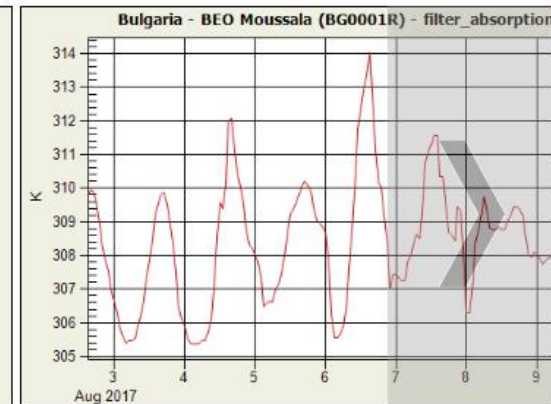

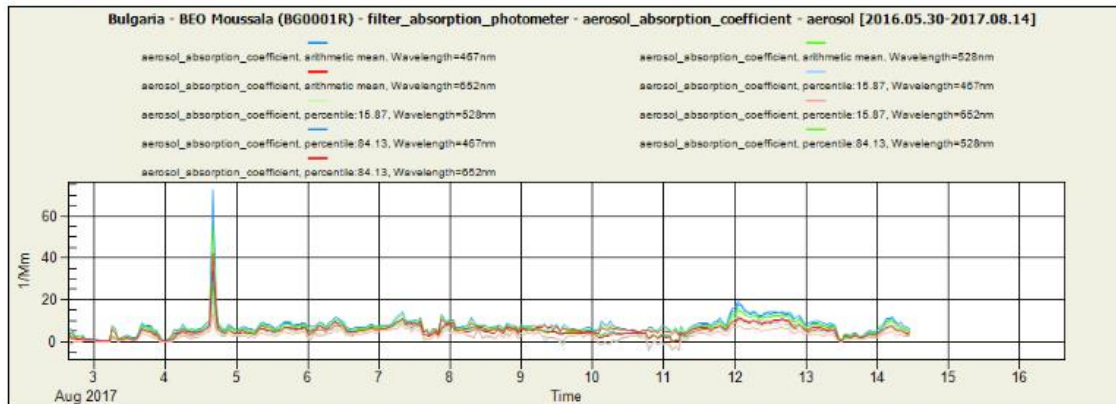

About 2180 Lidars und ceilometers globally (April 2016): 2016 ceilometers and 160 Lidars

WMO feasibility study toward a WMO intercomparison of volcanic ash observation tools

- In December 2014, the 13th meeting of the WMO-CIMO management group has nominated Météo-France in conducting a feasibility study about an **inter-comparison of instruments** for the detection of **aerosols** and **volcanic ash**.
- The **management group and task team** are established.
- This was initially focused on **lidars** and **ceilometers**. Since WMO-CIMO requested a widening of the scope: **Space-based** systems and **in-situ** measurements
- **May 2016, WMO, Geneva**: A meeting is arranged as a face-to-face and supplemented by webconf
- The goals will be to **discuss about progress, difficulties and specific issues** and to discuss further the issues
- The deliverable of the Task Team is the feasibility study requested by WMO-CIMO based on the LET report and on other documents (and) covering the perimeter required.

Recommendation from Satellite Research Community

- VAACs, VOs, and the remote sensing research community are encouraged to form collaborative links for training and interpretation of events.
- The volcano ash community is encouraged to formulate requirements (parameters, data formats, latency, possibly sites) to the GALION (WMO Global Atmosphere Watch Lidar Observation Network) and the ground-based aerosol network should also be considered.
- The providers of volcanic ash detection and retrieval products should liaise with data assimilation centres to foster modelling and forecasting capabilities.

FINAL REPORT

SAG-APPS

**GAW Scientific Advisory Group
(SAG) on Modelling Applications
(SAG-APPS)**

GAW SAG on NRT Modelling Applications

Established in 2016 by WMO Congress to enhance the exchange between the GAW observational community, the modelling communities and other-end users of atmospheric composition data.

- SAG will contribute to enhancing exchanges between the GAW community and different end-user and modeling communities with respect to atmospheric composition data, especially for near-real-time data applications on regional to global scales
- SAG-Apps is to demonstrate the usefulness of exchanging chemical observational data in Near-Real-Time in support of monitoring and forecasting applications.

GAW SAG on NRT Modelling Applications

Science Advisory Group members

**Vincent-Henri Peuch, co-chair,
ECMWF, UK**

Frank Dentener, co-chair, JRC,
HTAP, Italy

Arlindo Da Silva , NASA, USA

Georg Grell, NOAA, USA

Mathew Hort, Met Office, UK

Michaela Hegglin, UniReading, UK

Michail Sofiev, FMI, Finland

Paul Makar, ECCC, Canada

Taichu Tanaka, Japan, ICAP

Zhou Chunhong, CMA, China

FMI Experience: Data assimilation for predicting a volcanic tracer

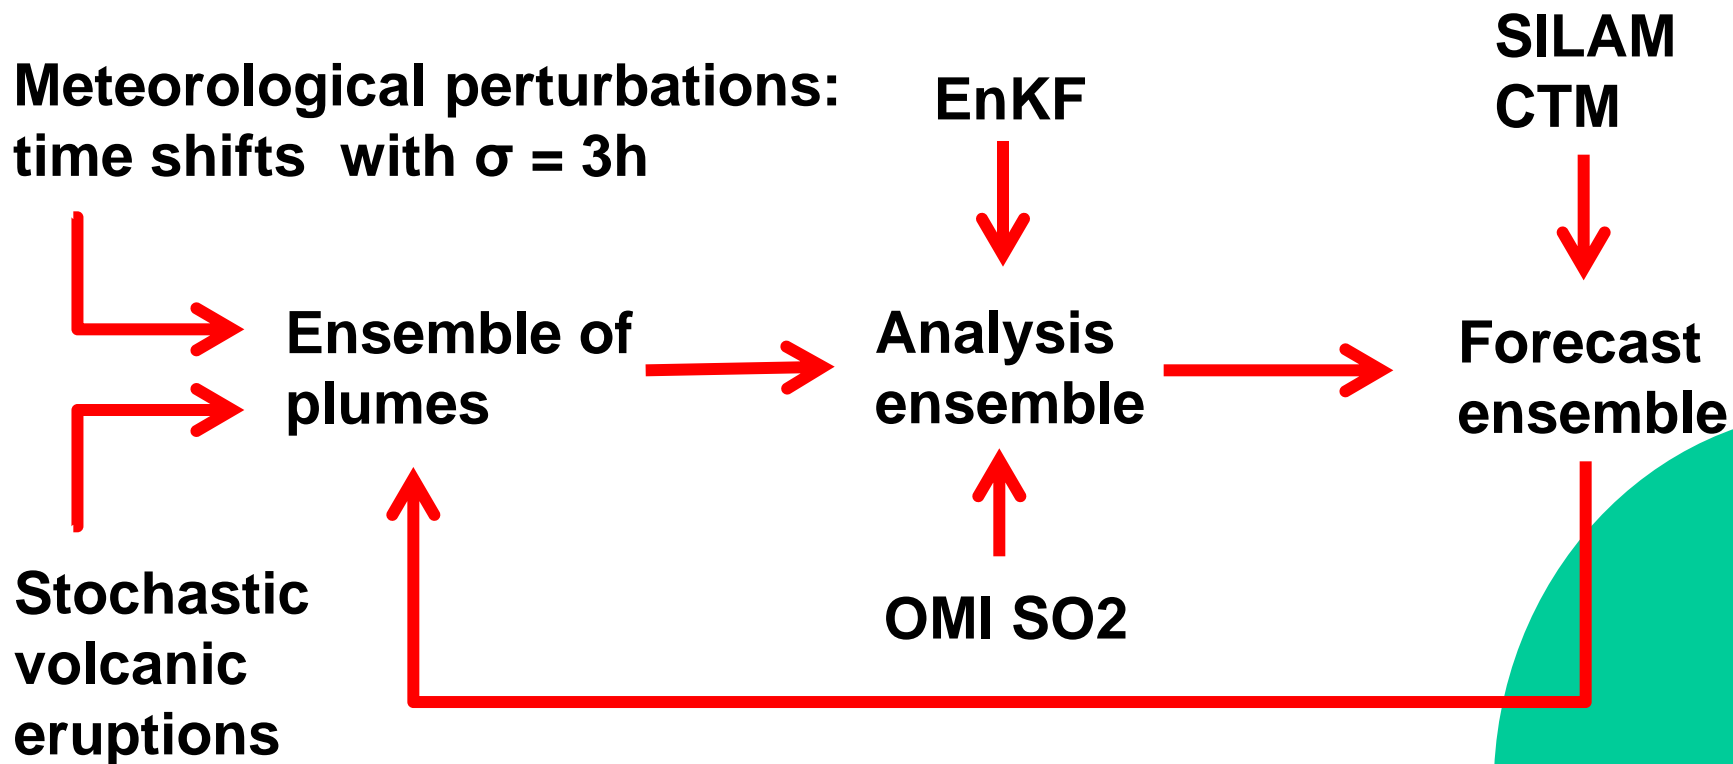

- How to combine **2D** map of column density retrievals of **SO₂** with **transport modelling** to obtain a realistic **3D** prediction of a volcanic plume
- Can we do this without inverse modelling of the source term – instead, by continuously updating the prediction with observations?
- Can we provide error estimates accounting for both model and observation errors?
- Application to the Kasatochi SO₂ release during 2 weeks following the eruption on 7-8 August 2008

GOES-R Volcanic Ash Risk Reduction: Operational decision support within NOAA's Rapid Refresh (RAP)

Martin Stuefer (UAF), Peter Webley (UAF), Georg A Grell (NOAA-ESRL), Mike J Pavolonis (NOAA-NESDIS)

GOAL: Implement volcanic ash parameters within NOAA's Rapid Refresh (RAP/HRR) modeling system as a pathway to operational volcanic ash prediction using GOES-R data assimilation. Initial steps are

- **Extend RAP/HRR with WRF-Chem volcanic emission model.**
- **Case studies and comparison with GOES-R volcanic ash detection and height baseline product.**
- **Assess computational costs.**
- **Use VAAC volcanic activity data feed to initiate near real time WRF-Chem model runs (currently WRF-Chem runs are performed daily at the University of Alaska Fairbanks).**

THE VISION: INCLUDE GOES-R VOLCANIC BASELINE PRODUCT IN RAP/HRR

GAW Modelling SAG

Suggestions for joint activities

Possible Initial tasks:

- Summary of current state of VAAC modelling, inversion and use of observations - both in operational use and what is being developed (overview / white paper as 1st task)
 - Aim: Expose existing R&D to enable wider R&D
- GAW assistance/collaboration in NRT access of GAW and other available observation data for VA modelling (Lidars, ceilometers, satellite, aircraft, in-situ,..)
 - Aim: Maximize use and utility of observation networks
- Collaboration with VASAG/VAACs, CIMO team is needed
 - Aim: To support VAAC and VASAG activity better

GAW Modelling SAG

Suggestions for joint activities

Possible further/future tasks (dependent on outcomes of earlier work):

- Analysis of new scientific achievements for VA modelling (includes inversion/DA) improvements
 - Aim: Recommendations for longer term research
- Modelling studies:
 - Model evaluation/analysis (VAAC and other models)
 - Aim: Draw out key aspects of models impacting forecasts
 - Inversion and data assimilation for volcanic plumes transport modelling and prediction
 - Aim: Compare current approaches to help inform future developments.
- Other ideas, suggestions, thoughts ?
