WE NEED YOUR HELP

Intergovernmental
Oceanographic Commission
(of UNESCO)

The international scientific community requires accurate environmental observations in real-time from the world's sea going commercial fleets.

The scientific community has developed many automated and semi-automated sampling systems that collect, process and transmit via satellite, a wide range of environmental observations that contribute to marine forecasting and address safety at sea issues.

We are looking to recruit a significant number of ocean going vessels to be equipped with some or all of these scientific sampling systems to collect meteorological, oceanographic, atmospheric, chemical and biological observations.

The data collected support marine weather forecasting, El Nino-Southern Oscillation predictions, Indian Ocean Monsoon onset and strength, atmospheric and oceanographic modeling, as well as long-term global climate change research.

If you are interested in participating in this exciting international effort please contact:
