# Why we need a CWP on the XBT network?

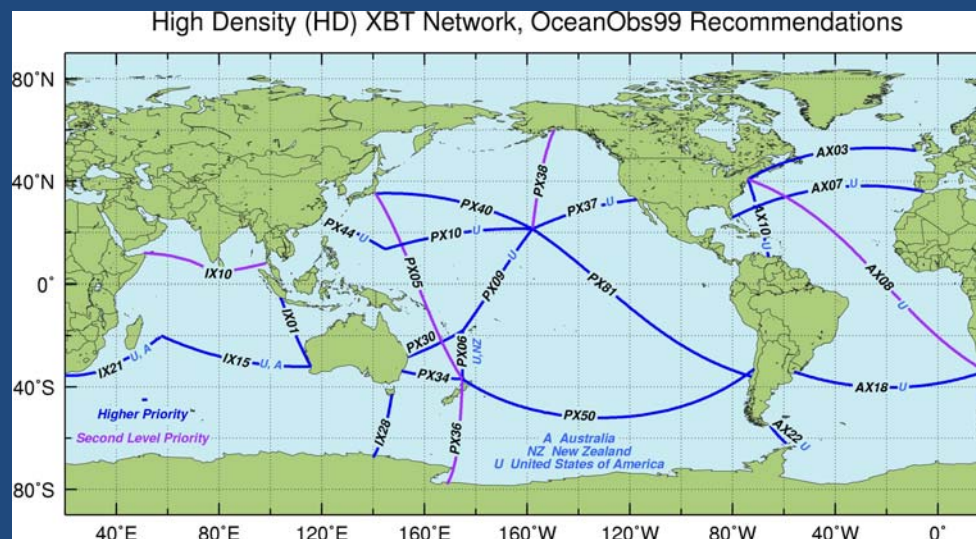

- To assess the state of the XBT network as recommended by the last upper ocean thermal review panel (OceanObs99).
- To communicate the value of XBT observations in scientific research and in model initialization.
- To evaluate if the O009 network still holds
- To make new recommendations based on the current knowledge of the ocean, the full implementation of Argo, operational altimetry, improvement of ocean models, etc.

# OceanObs99 recommendations

FR recommendations  
NO LD recommendations

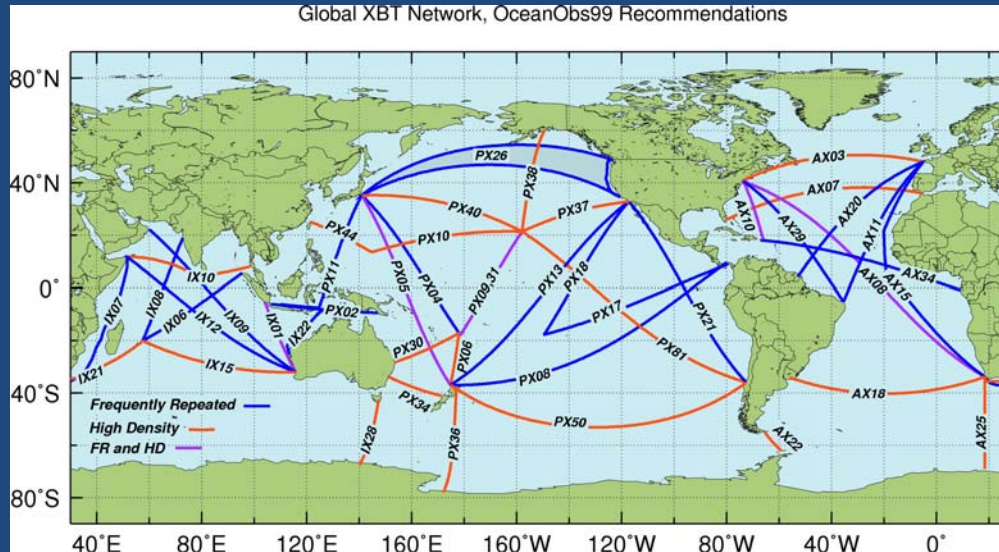

HD recommendations

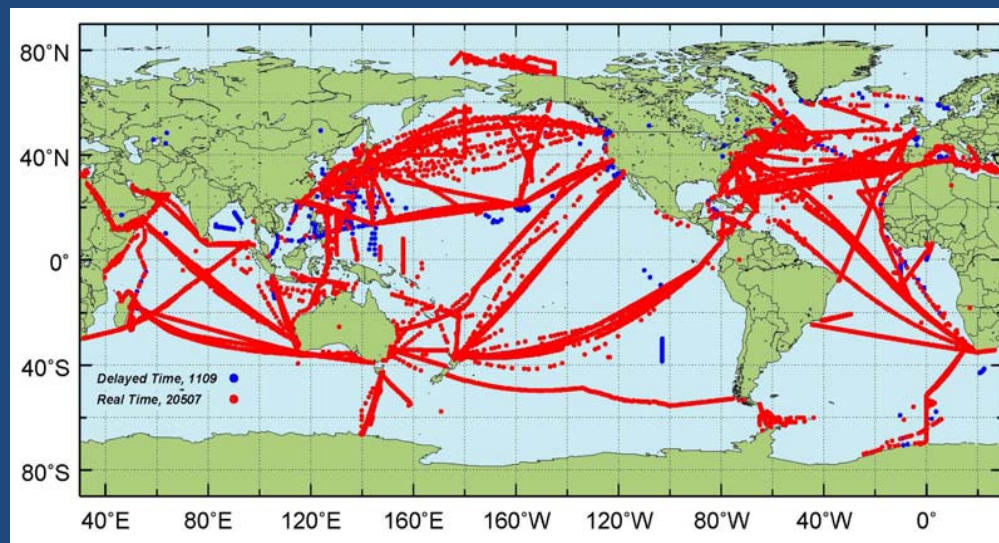

Adapted from N. Smith et al

# XBT Network

OceanObs99  
Recommendations

2008

Recruiting problems with PX38, PX50, IX15, AX18.

# OceanObs09 SOOP CWP

- 1) Review status OceanObs99 recommendations.
- 2) Summarize goals of XBT transects in each of the three different modes.
- 3) Summarize key results obtained from XBT observations.
- 4) Highlight key results:
  - AMOC, by NOAA/AOML
  - ACC, by UCT and AOML
  - tropical Pacific, by SIO
  - Indian Ocean, by CSIRO and NIO
- 5) Provide recommendations:
  - Transects
  - Data transmissions
  - Data management

# OceanObs 1999 Recommendations

- 1) Begin phase reduction of LD sampling. **Done.**
- 2) Have sufficient overlap between LD and Argo floats. **No.**
- 3) Build network based on existing transects. **Done.**
- 4) Data distribution in RT 12-h delay. **Now done in 24 hours.**
- 5) Perform delayed-mode QC. **Currently done by GTSP, WData**
- 6) Full depth resolution. **Being partly done. (Is FR needed in RT?)**
- 7) Unique identifier. **Partly done.**
- 8) Identify data originators. **Will be done when BUFR is implemented.**
- 9) Develop a world ocean data base. **Done by GTSP and**

# Three sampling modes

## Low Density (LD)

- Investigate intraseasonal to Interannual variability in the tropical oceans,
- Measure temporal variability of boundary currents, and
- Investigate historical relationship between sea height and upper ocean thermal structure.

## Frequently Repeated (FR)

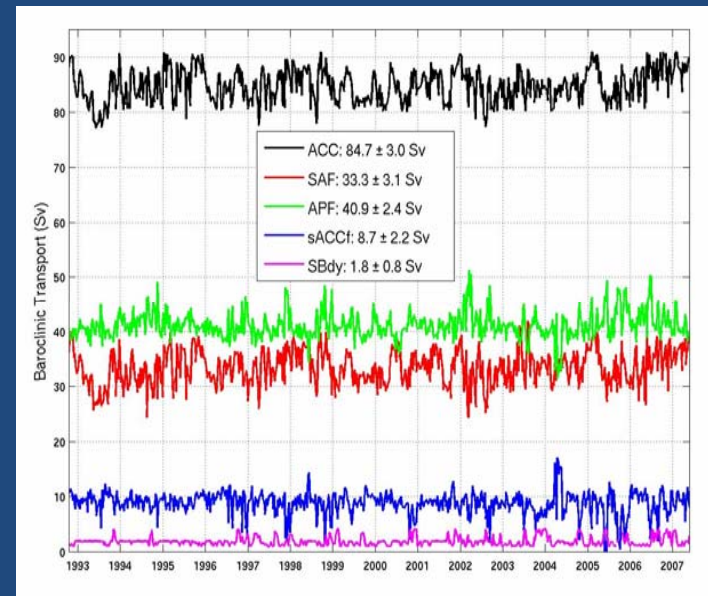

- Measure the seasonal, interannual, and decadal variation of volume transport of major ocean currents.
- Characterization of seasonal and interannual variation of thermal structure and their relationship with climate and weather.
- Identify the relationship between sea surface temperature, depth of the thermocline and ocean circulation at interannual to decadal timescales.
- Rossby and Kelvin wave propagation.
- Validation of variation of thermal structure and currents in models.

## High Density (HD)

Seasonal to interannual fluctuation of mass and heat transports  
Determine synergy between XBT and altimetry observations  
Variability of boundary currents, fronts, eddies, rings.

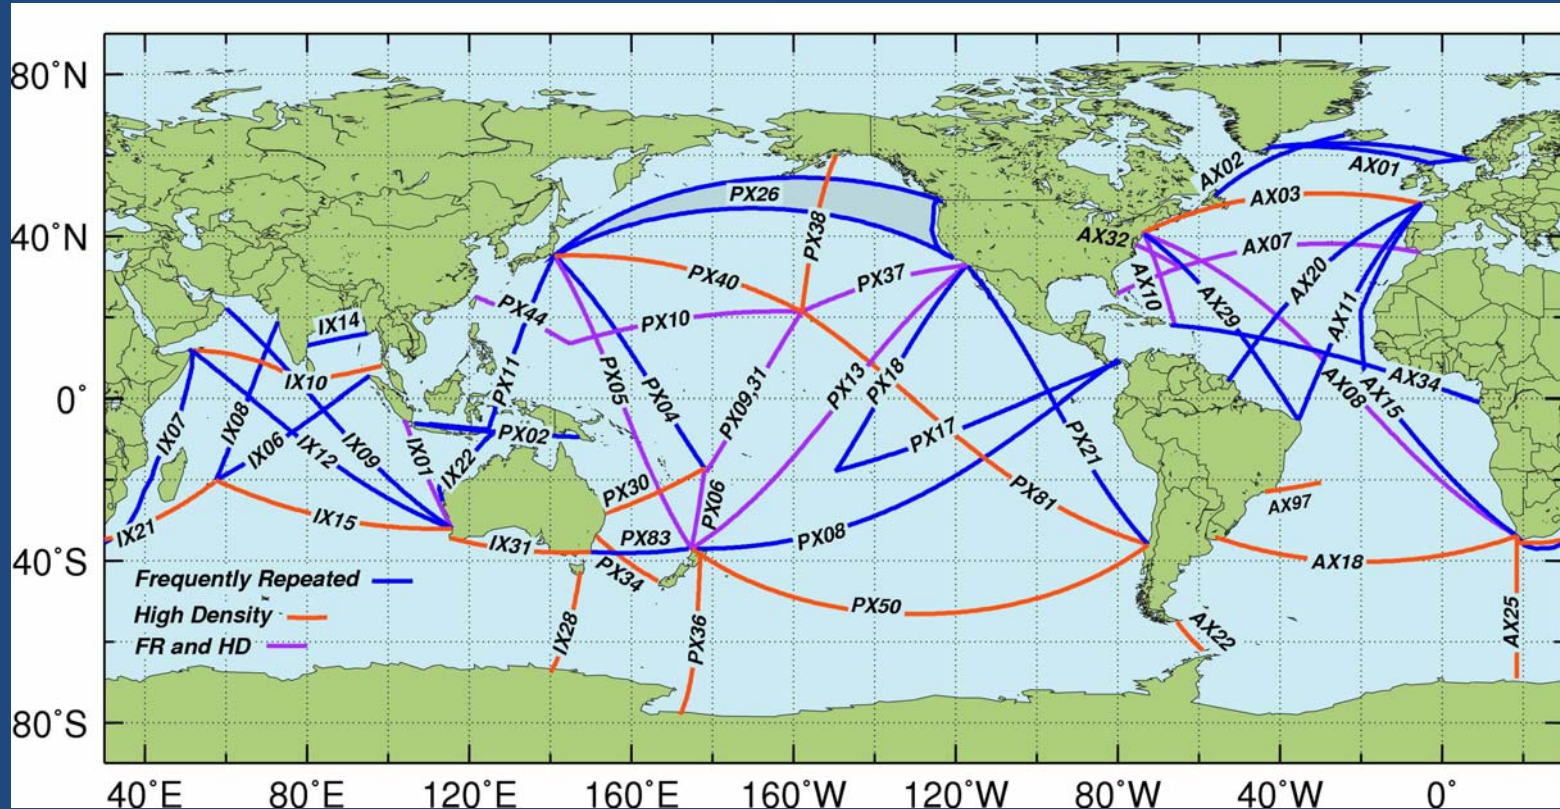

# Key Results

# OceanObs09 recommendations

No OO99 transects dropped  
Only 2 recommended modes (FR, HD)  
A few transects added (AX98), reinstated (AX32)

# OceanObs 2009 recommendations

- JCOMM should sponsor analysis to evaluate XBT network,
- New transects,
- Continue strong support of FR and HD modes,
- Create an XBT Science Team, similar to Argo Science Team,
- Continue experiments to evaluate XBT biases,
- Support simultaneous observations of other parameters,
- Data management following GCOS requirements,
- Explore new technologies,
