

Application of Forecast Probabilities: SA input

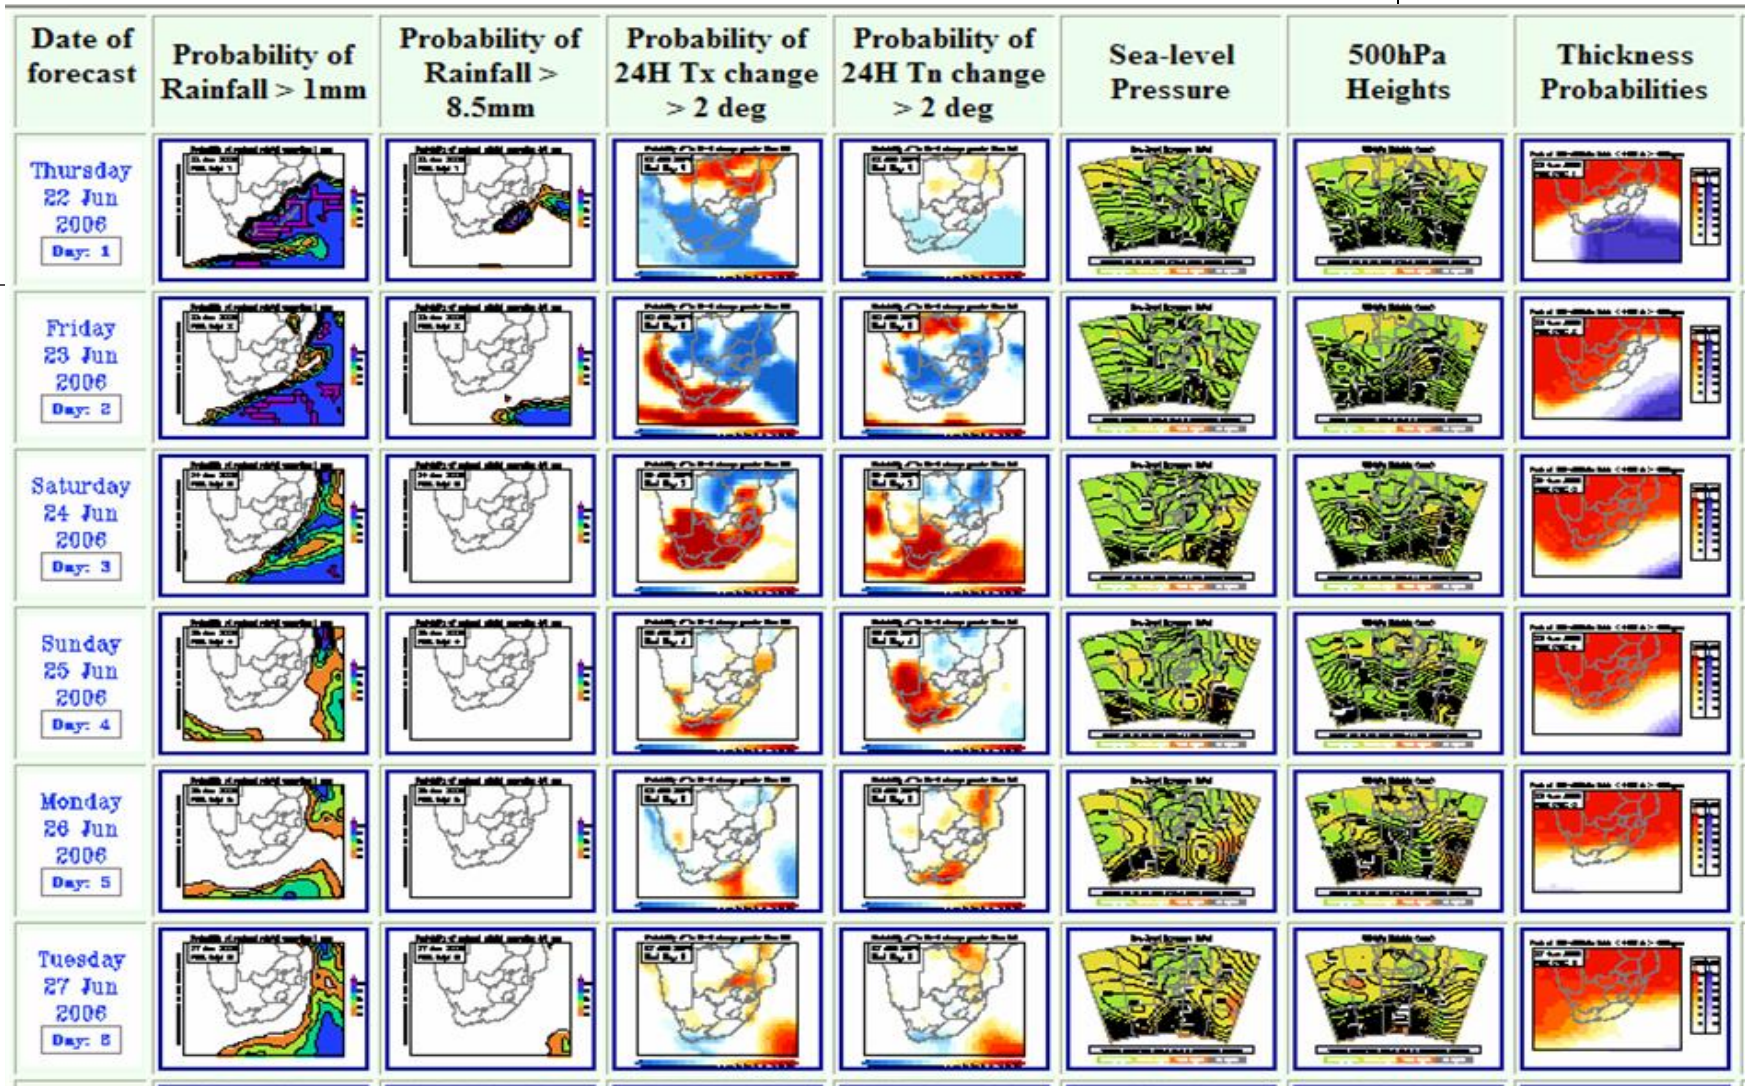

Eugene Poolman
SAWS

South African
Weather Service

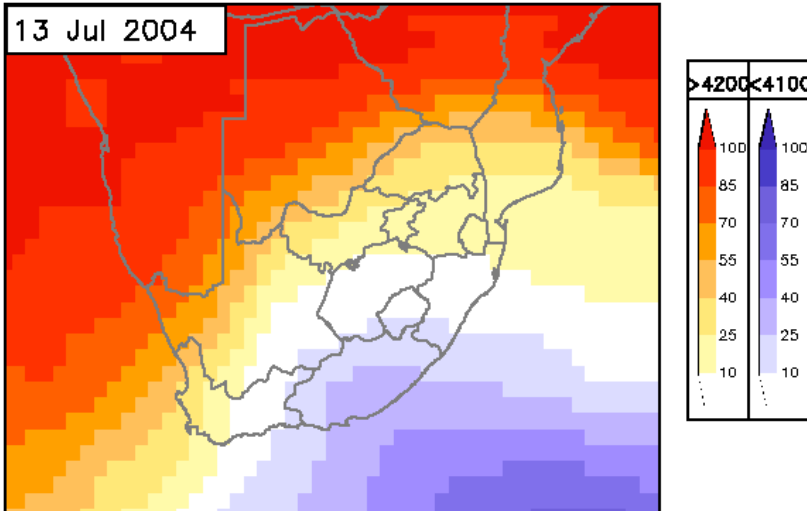

Web-based Ensemble prediction product

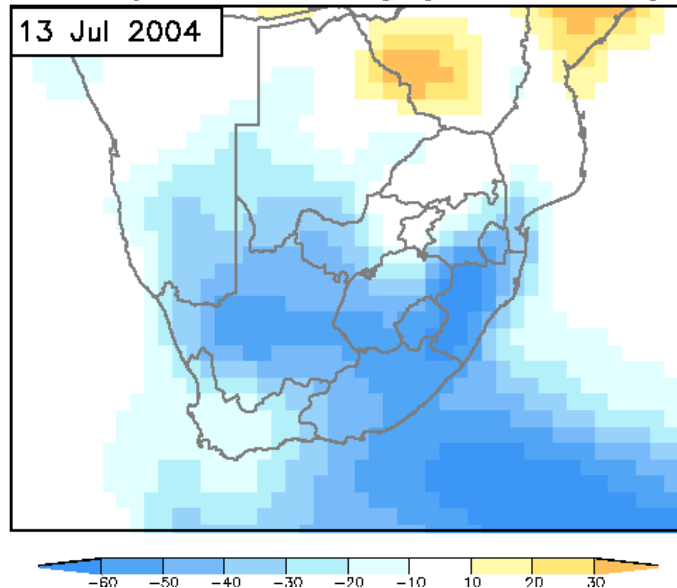

Forecast for 13 July: 6 days in advance

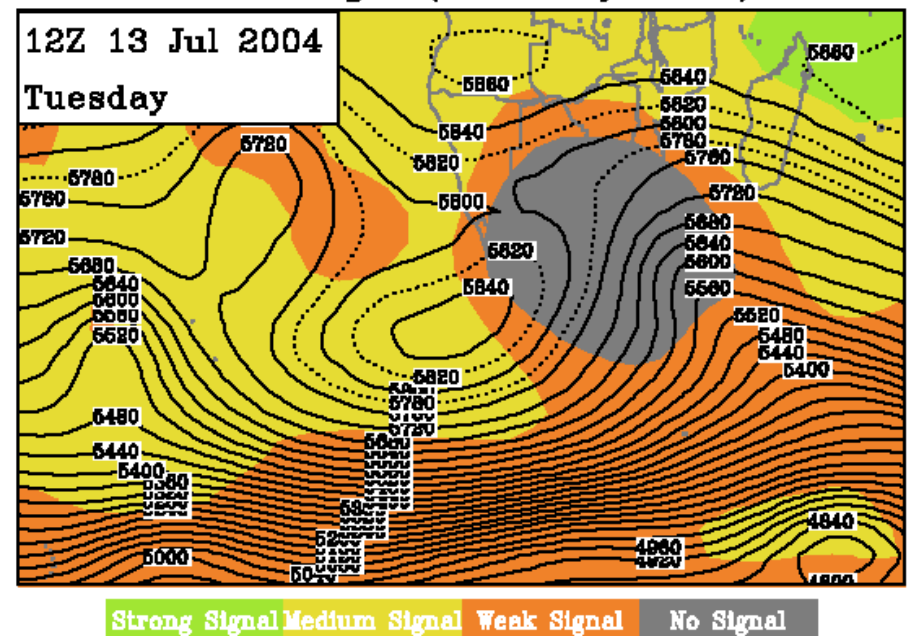

Prob of 850–500hPa Thick < 4100 & > 4200gpm

Probability of Tx 24-H change greater than 2 deg

500hPa Heights (uncertainty shaded)

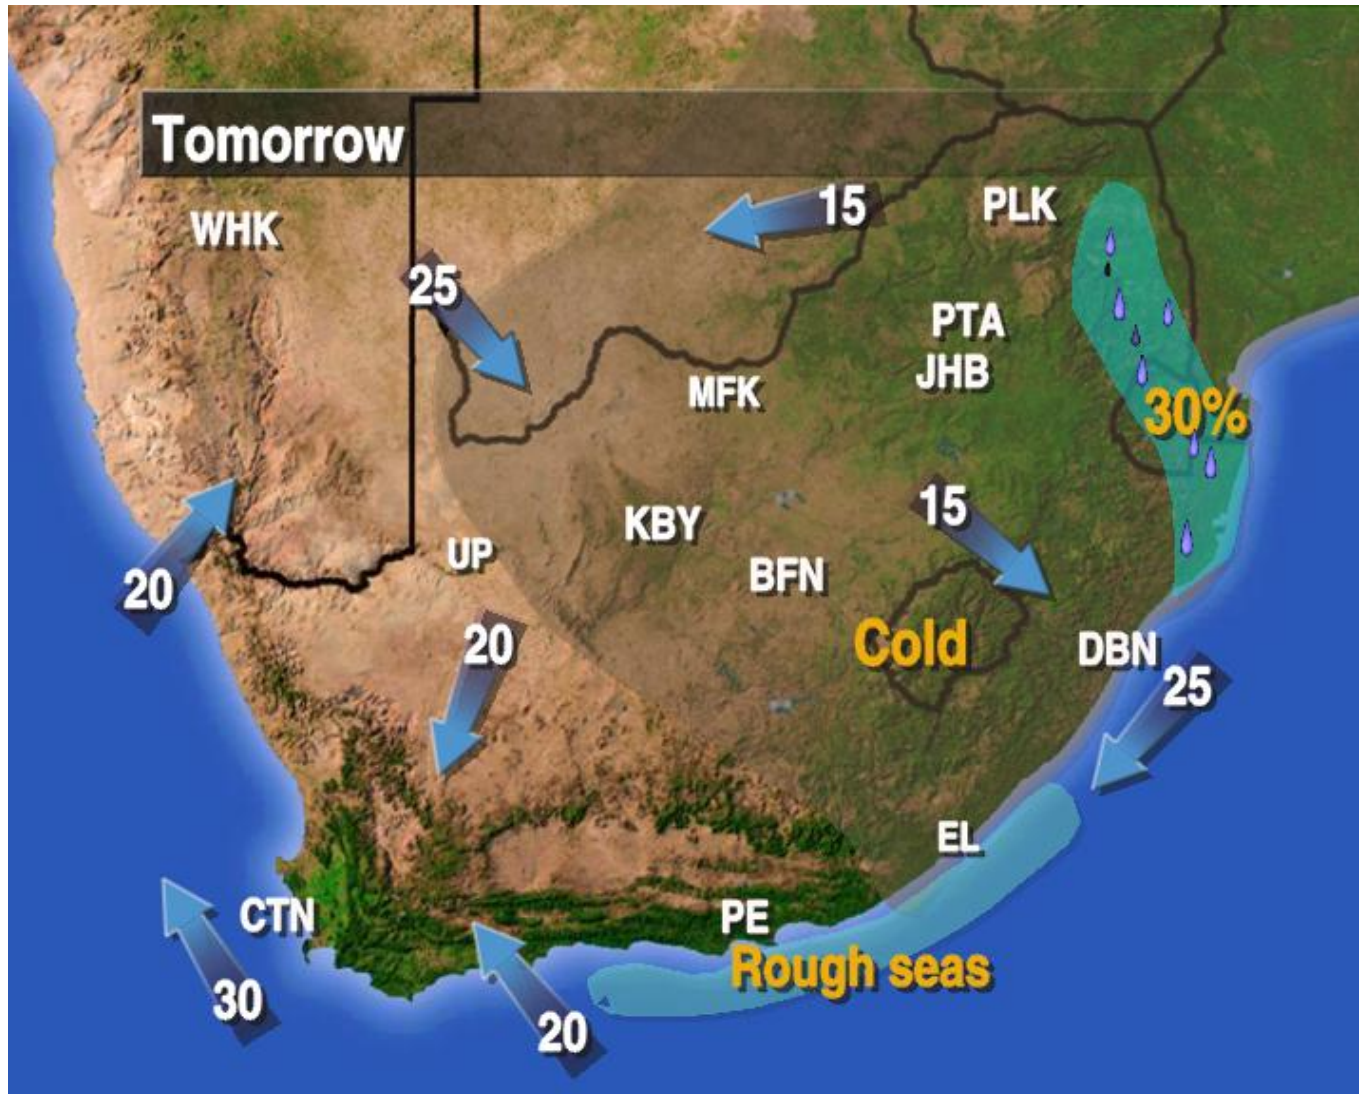

Benefits of ensemble prediction

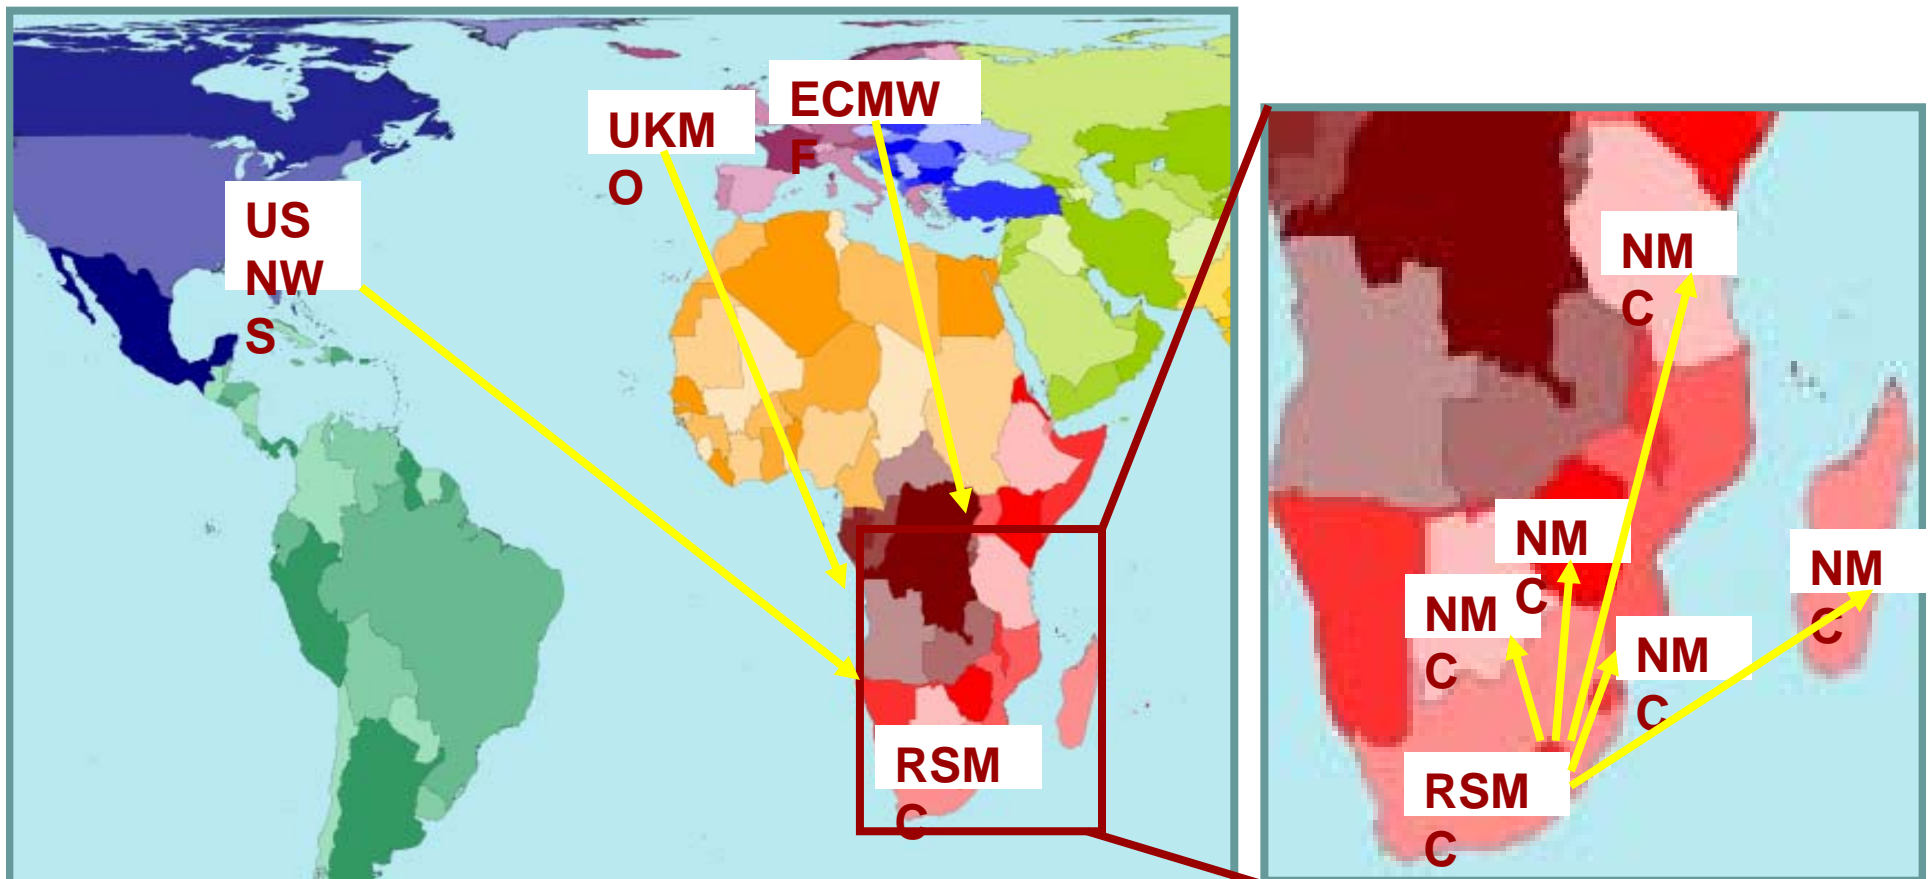

- It provides forecasters
 - with a set of 23 possible future scenarios,
 - that can be used to compute the probabilities of possible future weather events.
- It allowed forecasters to extend reasonable predictability far beyond the traditional 2 day forecasts
- SAWS uses ensemble products to issue advisories for the next 3-7 days on hazardous weather

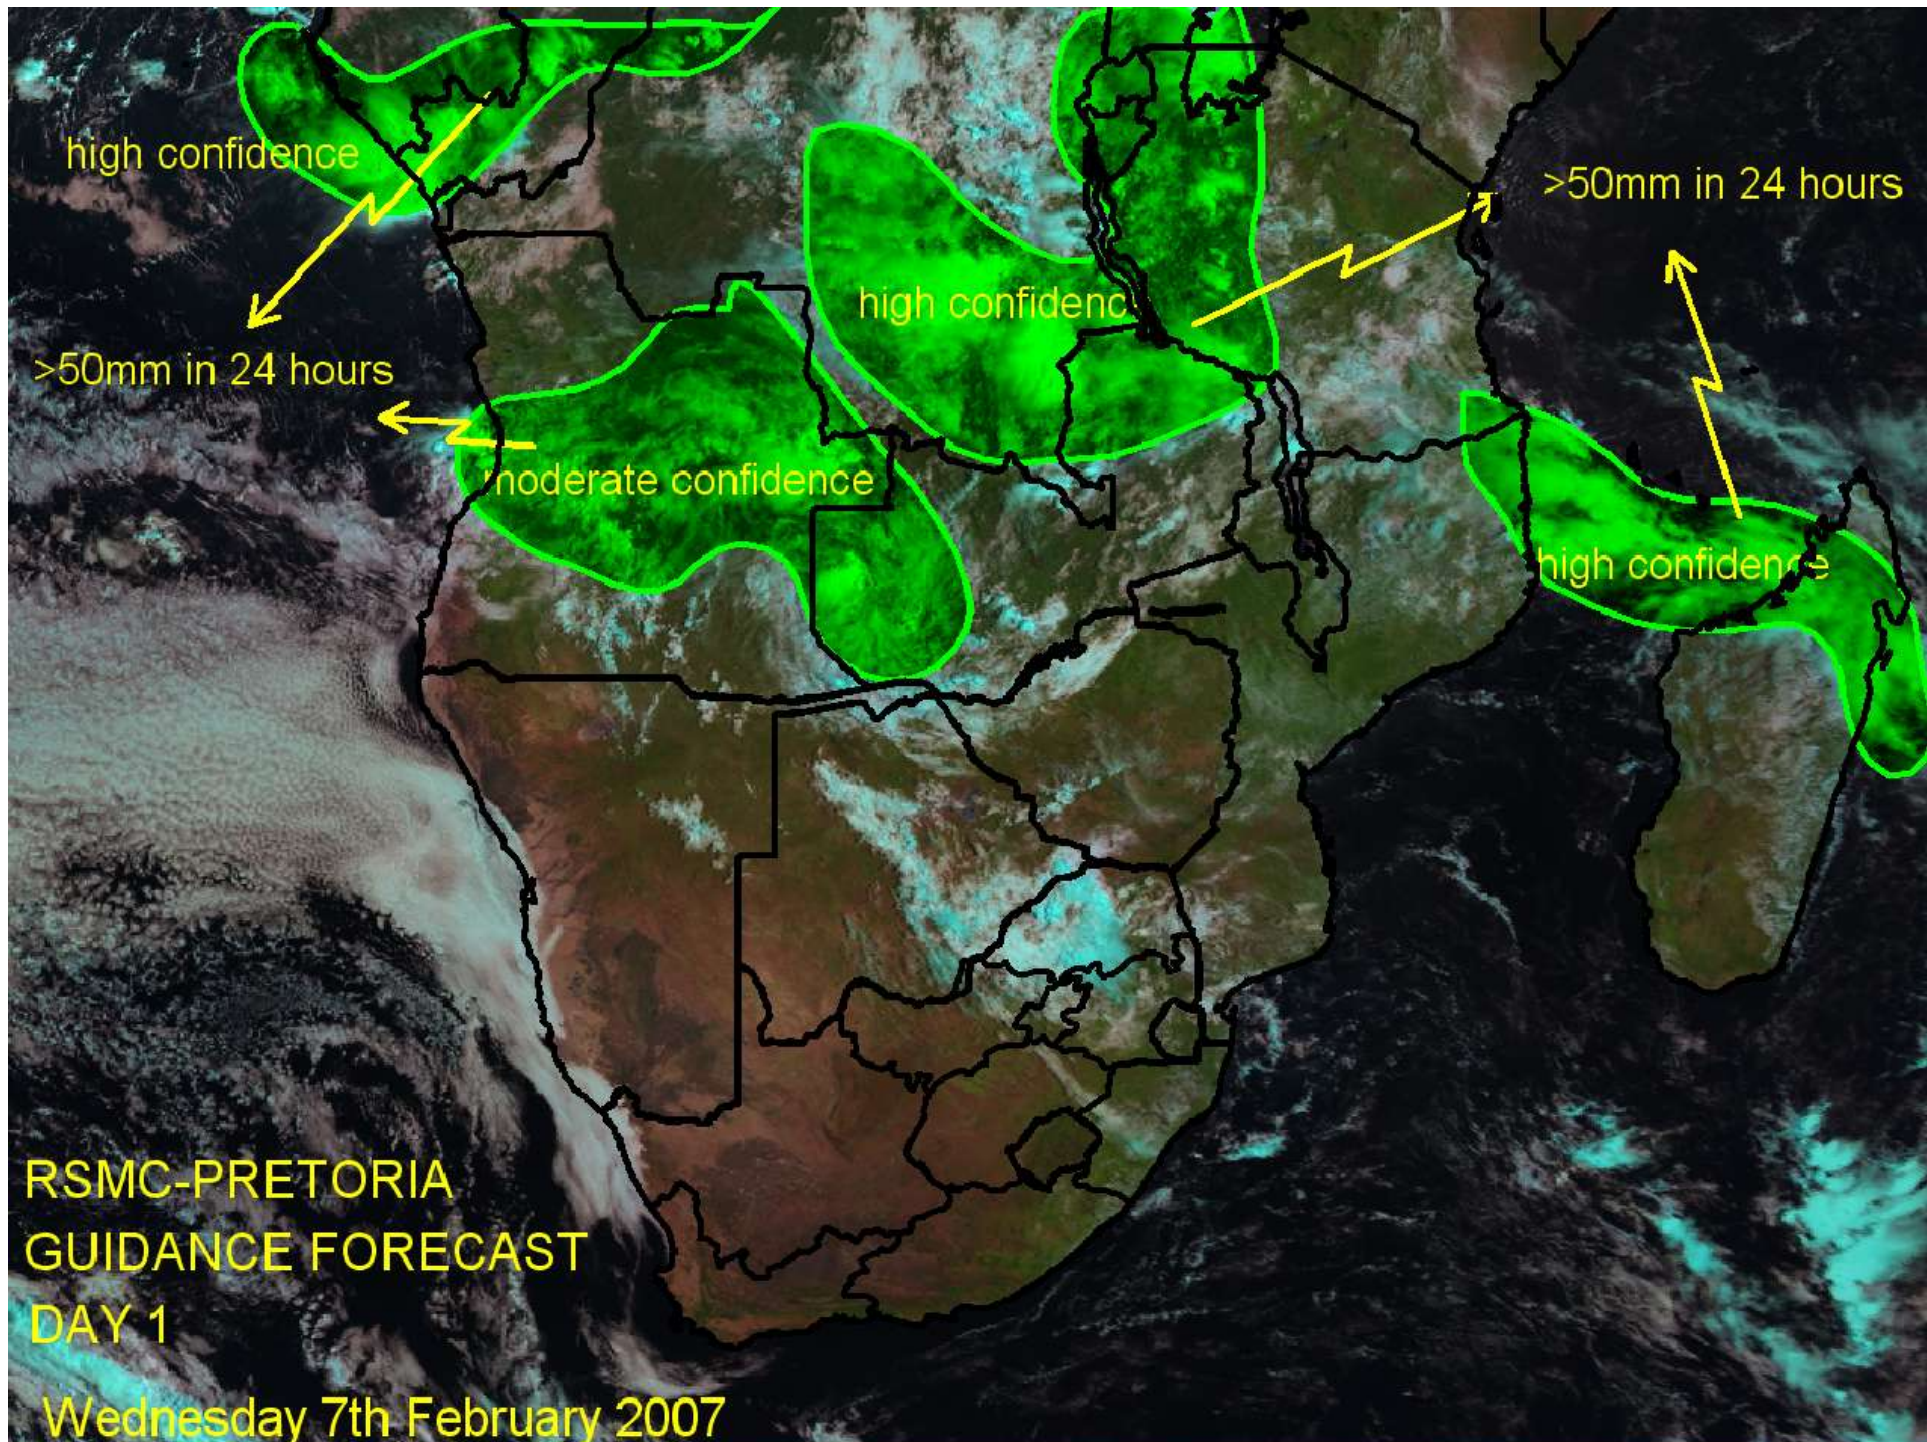

Rainfall probabilities on TV

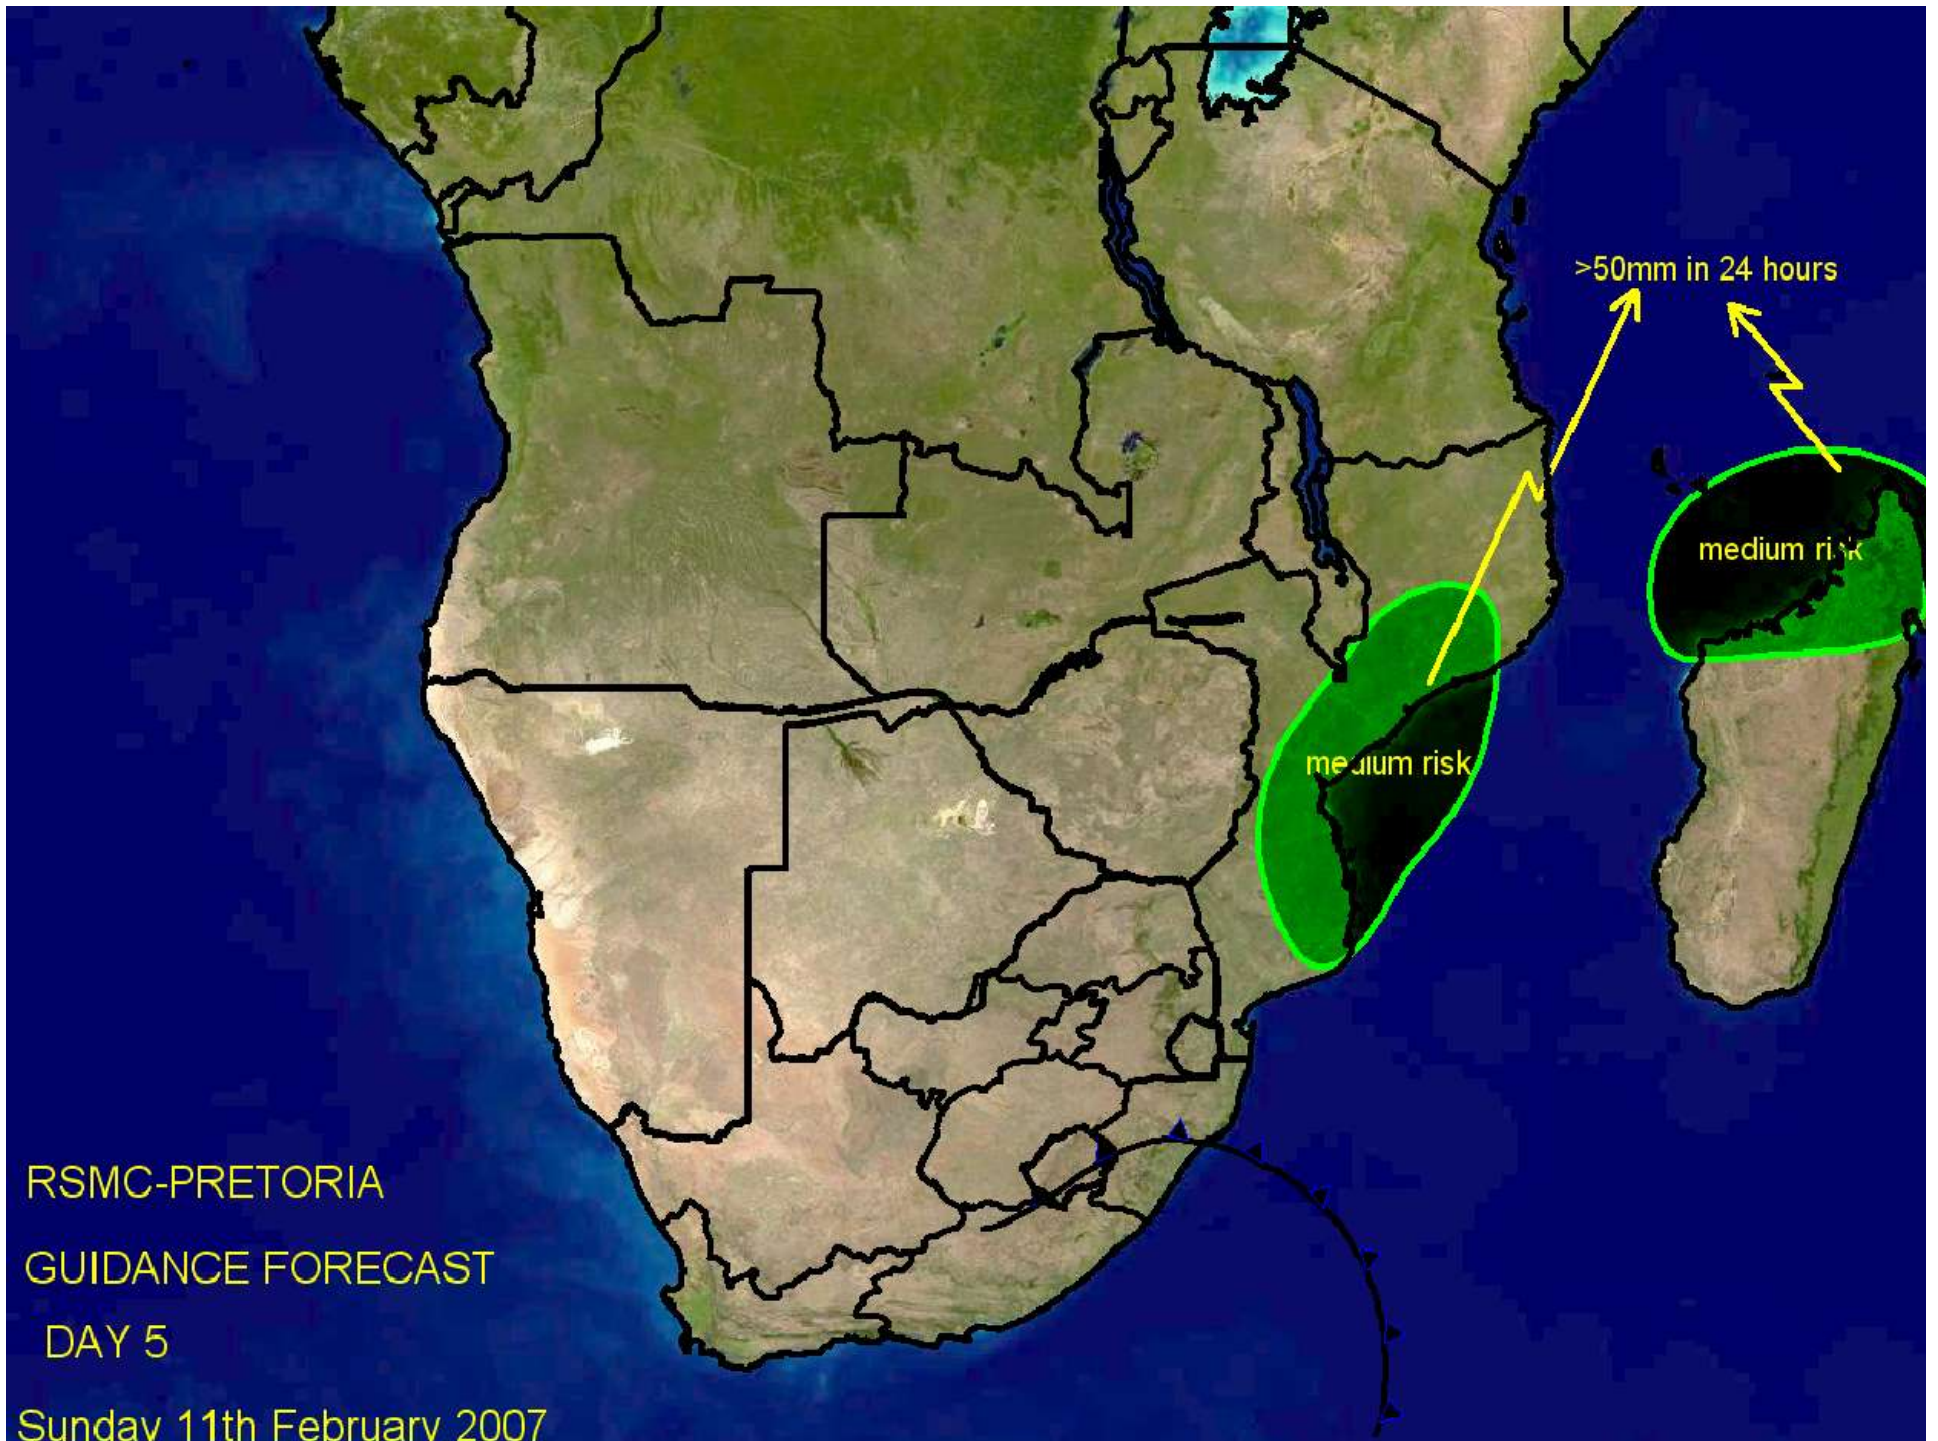

● Severe Weather Forecasting in SADC:

- Special products from *Global centres* to RSMC-Pretoria
- RSMC prepares guidance forecasts for next 5 days and disseminates daily to 5 NMCs
- NMCs use guidance forecast in preparing warnings when appropriate to disaster management authorities

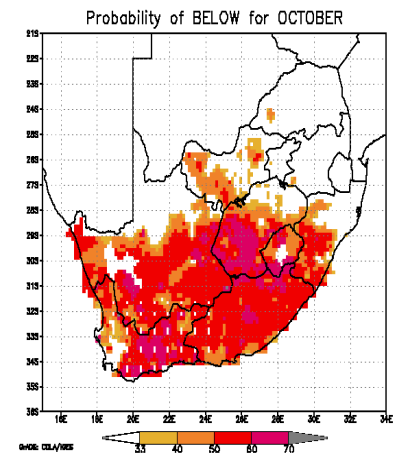

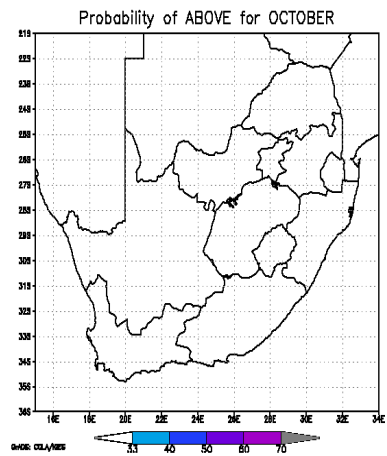

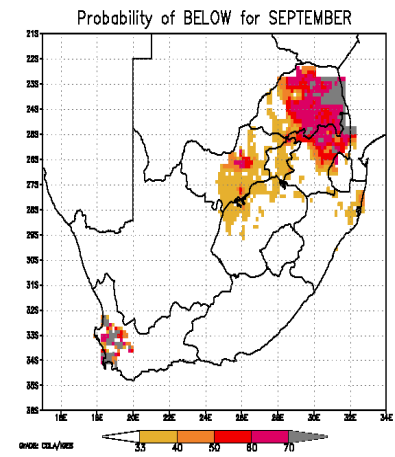

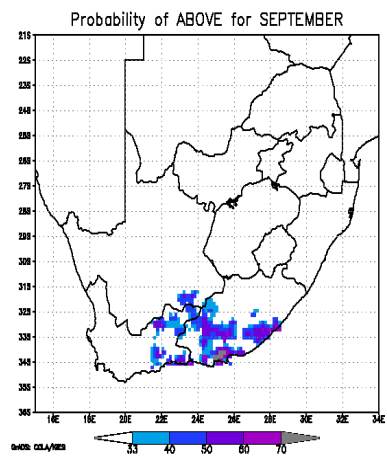

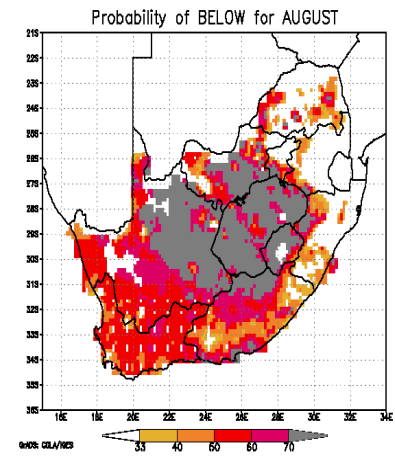

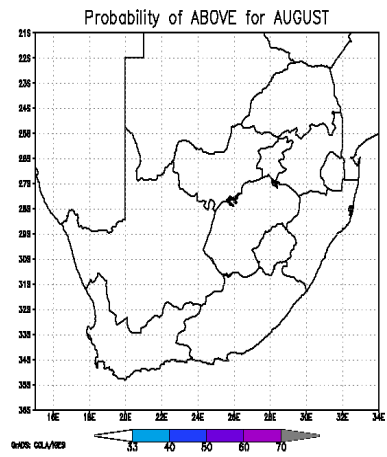

RSMC-PRETORIA

GUIDANCE FORECAST

DAY 5

Sunday 11th February 2007

Expected Total Rainfall for the period September-October-November 2007

AREA 1:

40% chance that the total rainfall for this period will be ABOVE-normal.

35% chance that the total rainfall for this period will be normal.

25% chance that the total rainfall for this period will be BELOW-normal.

AREA 2:

20% chance that the total rainfall for this period will be ABOVE-normal.

35% chance that the total rainfall for this period will be normal.

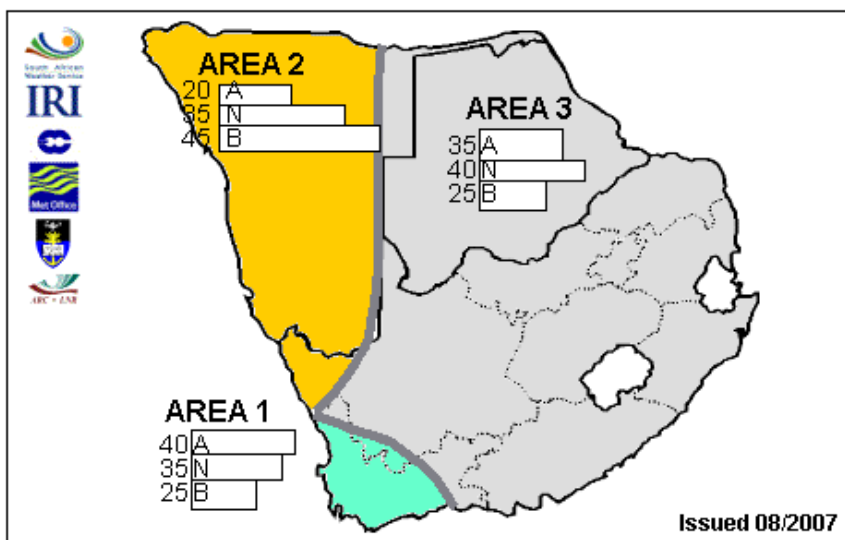

45% chance that the total rainfall for this period will be BELOW-normal.

AREA 3:

35% chance that the total rainfall for this period will be ABOVE-normal.

40% chance that the total rainfall for this period will be normal.

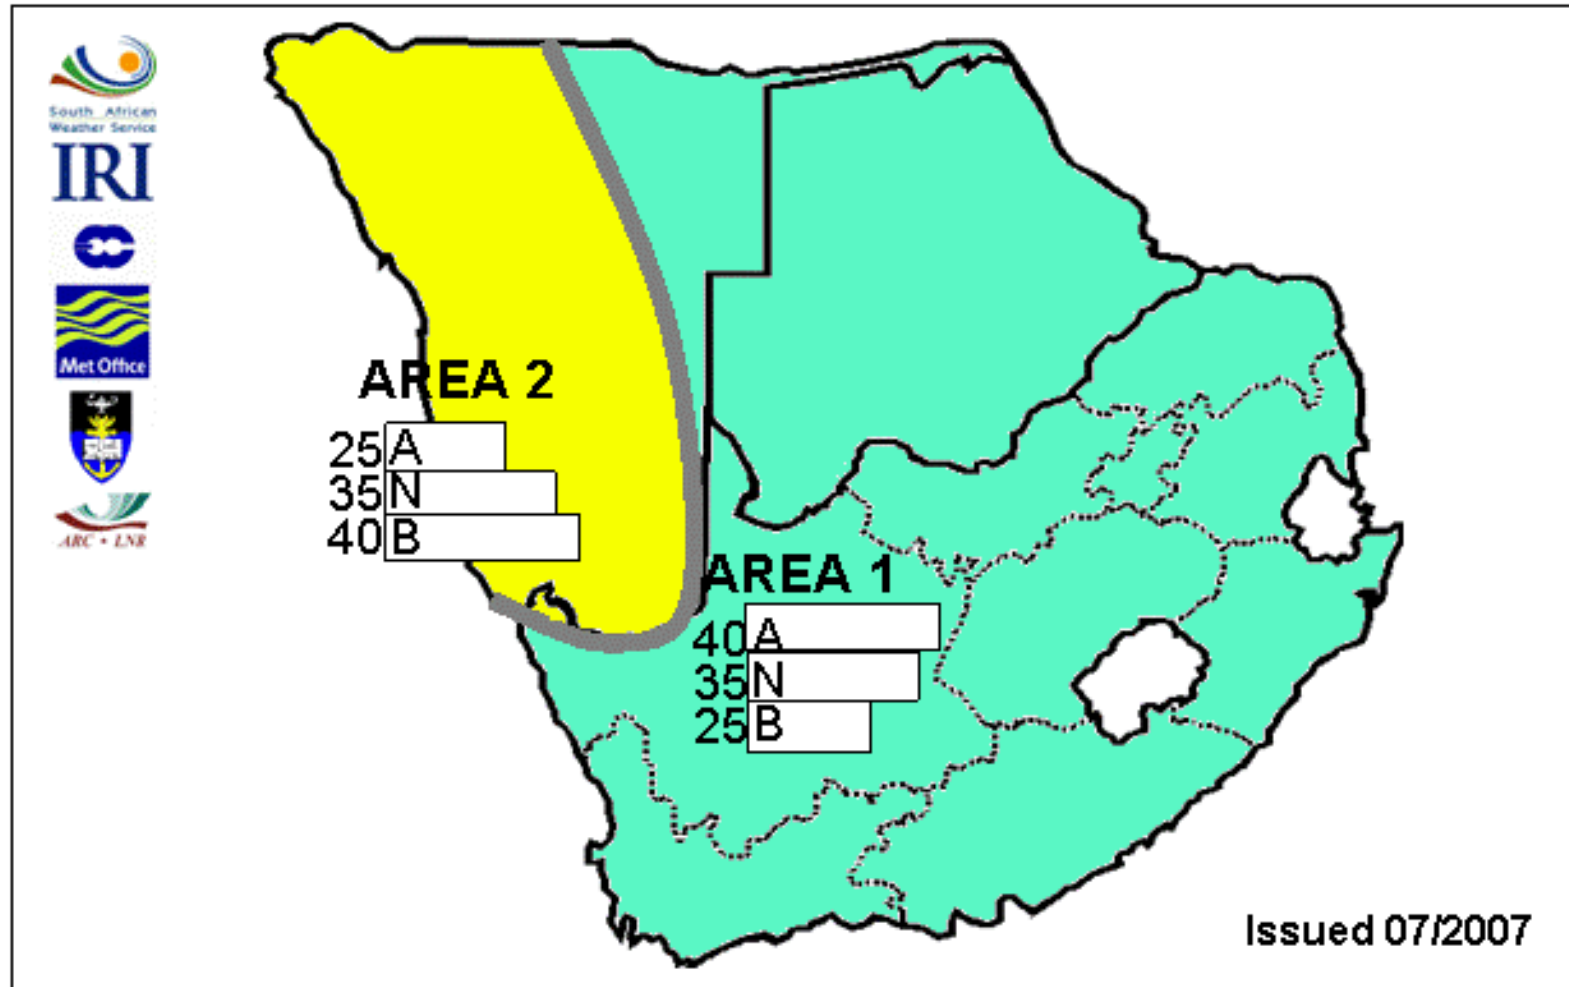

25% chance that the total rainfall for this period will be BELOW-normal.

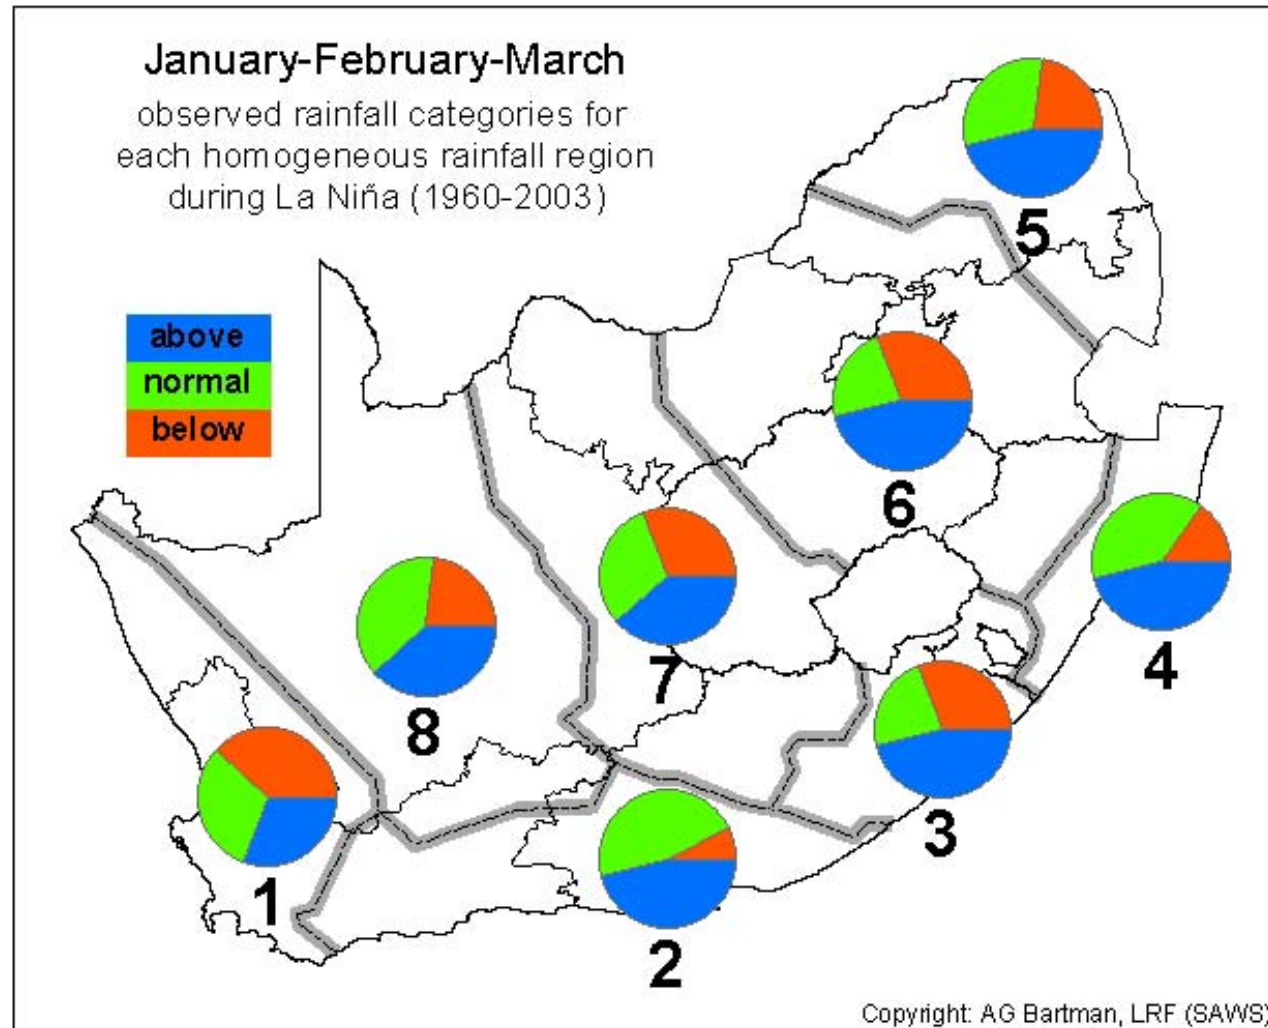

Please send comments to longrange@weathersa.co.za

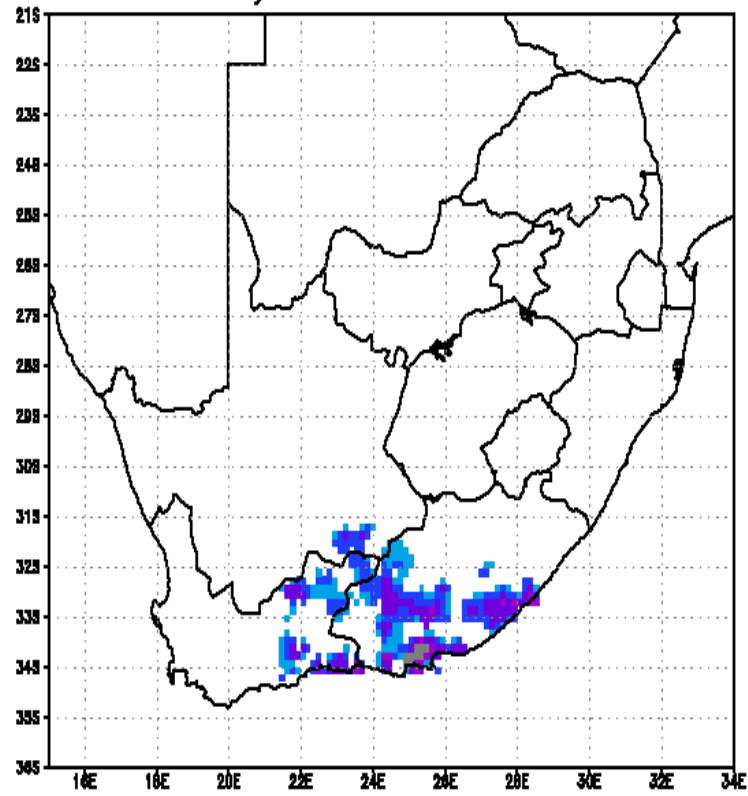

Expected Total Rainfall for the period Oct-Nov-Dec 2007

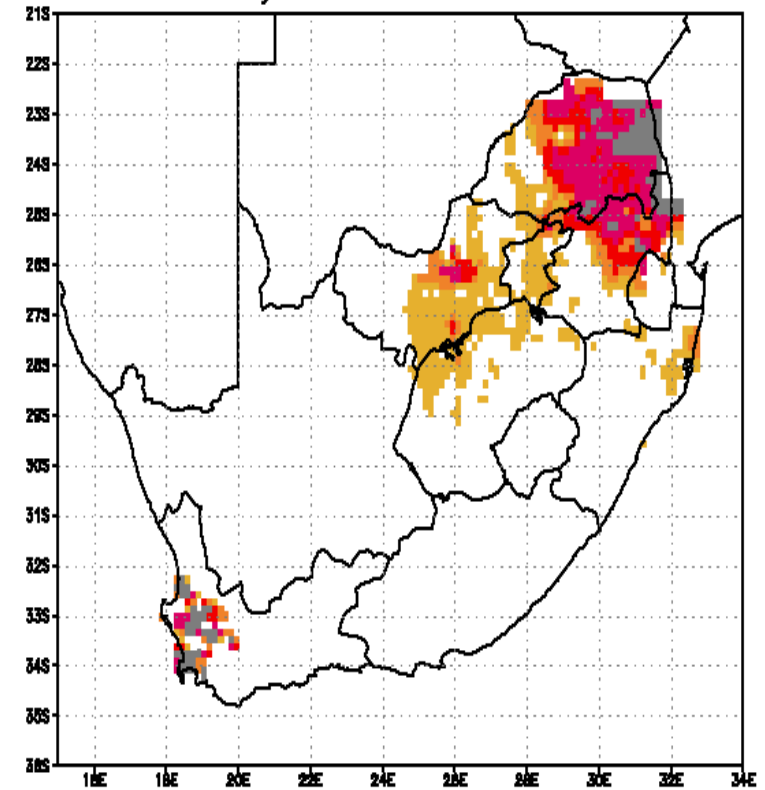

Probability of ABOVE for SEPTEMBER

GNDS: COLA/RES

Probability of BELOW for SEPTEMBER

GNDS: COLA/RES

| User | Reason | Uncertainty need | Method | Forecaster |
|----------------------|---|---|-----------------------------|--------------------------------------|
| Mohair farmers | Need 24 hrs to shed goats in to rain+cold+wind | Risk of adverse weather | Worded, SMS | Determine prob from EPS |
| Maize farmers | Rain forecasts for planting, | Seasonal outlook, specific | All | |
| Maize farmers | Wind and dust damage to crops | Risk of strong wind (>15 kts) | Worded | Forecast still deterministic |
| Grain traders | Market | Likelihood of rain, amount, distribution | Web, phone for confirmation | |
| Chokka boats (squid) | Inshore sea conditions | Sea state. "How sure are you" | Cell phone from boats | Deterministic, forecaster impression |
| Road engineering | No rain when tarring roads | Even a small chance of rain will stop operations | Worded - probabilities | False alarm is high, but POD also |
| Brickworks | Takes 6 hours to cover all brick drying outside | % of rain: 30% is their threshold | Web, maps | |
| Disaster management | Preparedness, early warning | Risk of hazardous weather, rather over warn, as early as possible | Worded, maps: SMS, email | |
| General Public | | | | |

Subjective Probability Estimation

Table 1: Forecaster Probability Calculator: Representative PoP and related terminology

| Thunderstorm and Shower Probability (Distribution x Confidence) | | | | Rain Probability (Areal distribution: extensive or 60-100%) | | | | | |
|---|------------------------------------|-----------------|------------------|---|---------------------------------------|--------------------|----------------|--------------|--------------|
| Forecaster Confidence | Areal Distribution (over 24 hours) | | | Forecaster Confidence | Temporal Distribution (over 24 hours) | | | | |
| | | Few | Numerous | | Extensive | | Now and then | On and off | Continuous |
| | Doubtful | Nil (0%) | Nil (0%) | | Isolated (30%) | Doubtful | Chance (30%) | Chance (30%) | Chance (30%) |
| | Possible | Nil (0%) | Isolated (30%) | | Scattered (60%) | Possible | Likely (60%) | Likely (60%) | Likely (60%) |
| Definitely | Isolated (30%) | Scattered (60%) | Widespread (80%) | Definitely | Occasional (80%) | Intermittent (80%) | General (100%) | | |

Table 2: Forecaster Definitions (Input)

| AREAL COVERAGE (Showers and Thundershowers) | |
|--|---|
| Few | Little aerial coverage over 24 hours because: <ul style="list-style-type: none"> - No clear dynamical system. - Trigger typically heat or weak lower convergence in the absence of a clear dynamical system. - Tephz moderately unstable for T/S |
| Numerous | Good aerial coverage over 24 hours because: Clear dynamical system, such as an upper trough with associated divergence/uplift patterns, or a clear tropical convergence/ divergence pattern. |
| Extensive | Almost entire area covered over 24 hours because: <ul style="list-style-type: none"> - Strong dynamical system, like a proper cut-off low, strong tropical low, etc. - Rarely for thunderstorms |
| TEMPORAL DISTRIBUTION (Rain) | |
| Occasional | Rain now and then with longer dry spells in between. Weak front or high ridging, etc. |
| Intermittent | Rain on and off with short dry spells in between. Well developed front, strong ridging, etc. |
| General | Rain continuous all over area and all the time. Well defined cut-off low or tropical low |
| FORECASTER CONFIDENCE (Based on guidance by models, data & forecaster experience) | |
| Doubtful | There are some indication by a model or some data, although evidence are not convincing, most models disagree |
| Possibly | Some models or data agree, others not convincing. There is still some doubt. |
| Definitely | All guidance very strong and supportive, data clearly support, all models agree on identified phenomenon, forecaster absolutely convinced from experience, or already happening |

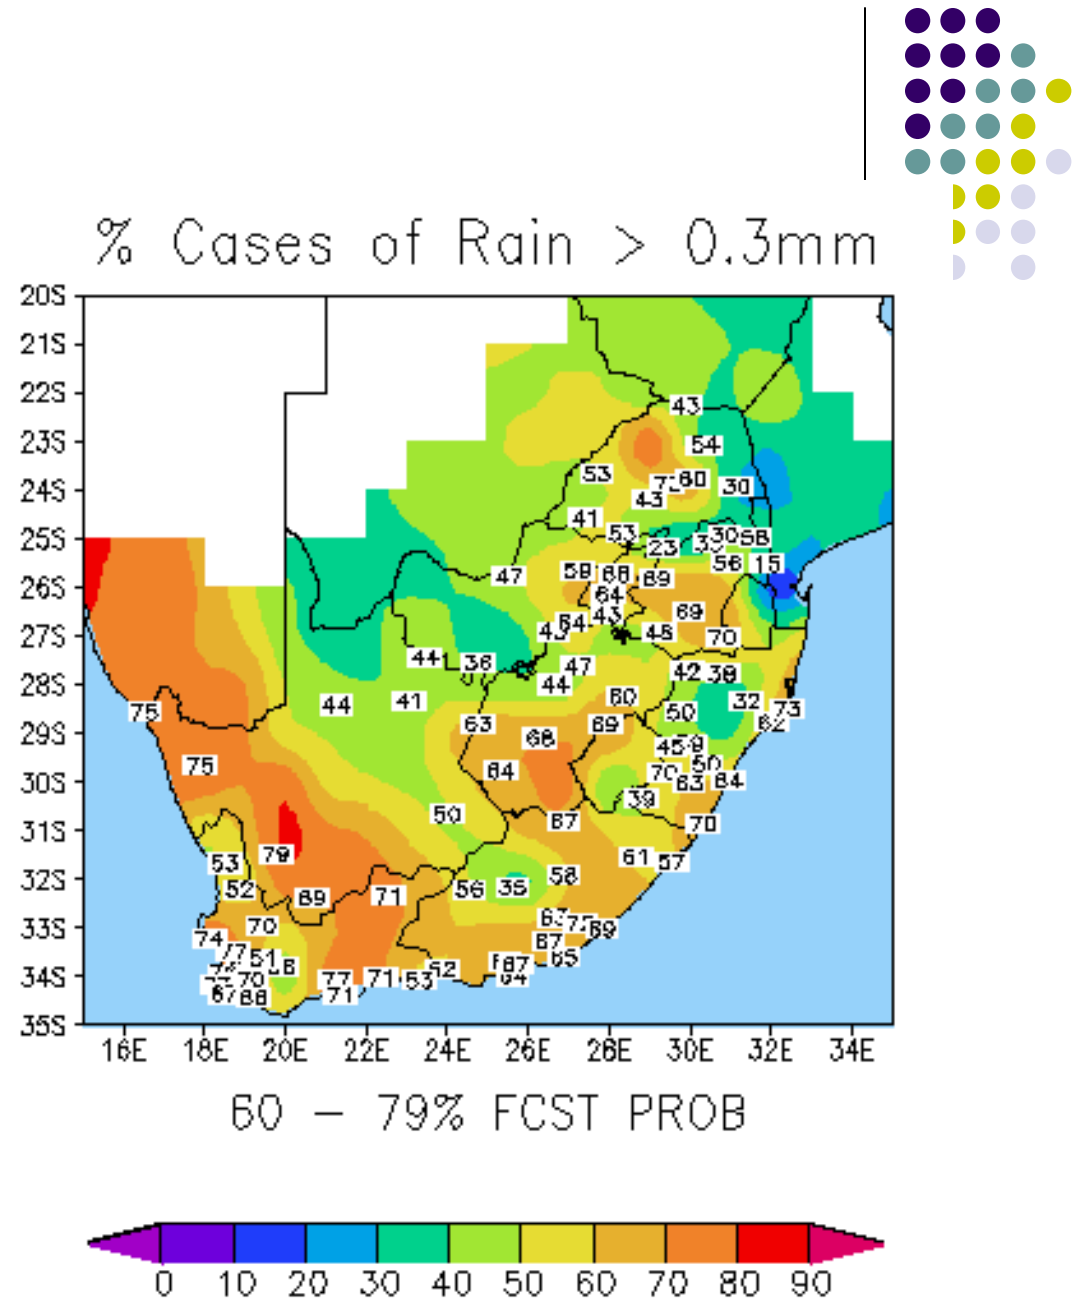

Table 3: Public products definitions (Output)

| <i>THUNDERSTORMS& SHOWERS (i.e. precipitation usually from convective clouds)</i> | | |
|--|------------|--|
| <i>Term</i> | <i>PoP</i> | <i>Definition</i> |
| Isolated | 30% | A couple of storms over the area, low chance of being affected where person is |
| Scattered | 60% | Numerous storm over the area, good chance of being affected where person is |
| Widespread | 80% | Storms over most of the area, very good chance of being affected where person is |
| <i>RAIN (i.e. precipitation usually from non-convective clouds)</i> | | |
| <i>Term</i> | <i>PoP</i> | <i>Definition</i> |
| Chance | 30% | Possibility of rain is low |
| Likely | 60% | High possibility of rain |
| Occasional | 80% | Rain is definitely expected; will occur now and then with longer dry spells in between. |
| Intermittent | 80% | Rain is definitely expected; will occur on and off with short dry spells in between. |
| General | 100% | Rain continuous all over area and all the time (NB: this is irrespective of the intensity, it can be light rain and not necessarily heavy rain). |
| <i>ASSOCIATED PUBLIC PHRASES</i> | | |
| <i>Thundershowers or showers</i> | | <i>Rain</i> |
| Isolated thundershowers (showers) | | A chance of rain |
| Scattered thundershowers (showers) | | Rain is likely |
| Widespread thundershowers (showers) | | Occasional (intermittent)(general) rain is expected |

A Rainfall Verification Product: Forecast Reliability for day 2

- This measures the % of time rainfall occurred at stations when 60% rain was predicted
- For good reliability the % should be between 50 and 70%, or yellow and orange

Some General Comments

- Approach too top down (scientist/forecaster driven) and not enough user involvement
- Many do not know they ask for uncertainty information
- Others do not know that they can benefit from uncertainty info
- Users are at different levels - capacity building
- Need to cater for each user's specific needs: differ between them, one product does not suit all
- Must be able to reflect against a baseline = need for verification of probabilistic forecasts
- Need to cater for different needs per timescale
