

Forecasting Marine and Coastal Hazards

HURRICANE
EVACUATION
ROUTE

Daniel P. Brown, Jamie R. Rhome,
Hugh Cobb, and Robbie Berg

National Hurricane Center

7 March 2011

National Hurricane Center

Three branches focusing on different hazards

Hurricane Specialist Unit

Develop, coordinate (domestically and abroad), and issue tropical cyclone warnings, forecasts and outlooks in text and graphical format (~700 full advisory packages/yr)

- Forecasts
- Advisories
- Wind

“Off-season” outreach and public awareness programs

Applied research

Tropical Analysis and Forecast Branch

Marine/ocean and satellite analyses, forecasts and warnings in text and graphical format 24x7, (~100 products/day)

- Marine hazards

Conduct tropical cyclone (Dvorak) analyses for the hurricane specialists

Augments operational support staffing

Technical Support Branch

Computer systems support 24x7

- Storm Surge
Applications development and technology infusion

Storm surge guidance (real time; community planning; preparedness)

Emergency operational support staffing

NCEP HPC – Rainfall
NCEP SPC- Tornadoes
NCEP OPC- Marine (north of 31N)

NWS Marine and Coastal Weather Services

Mission

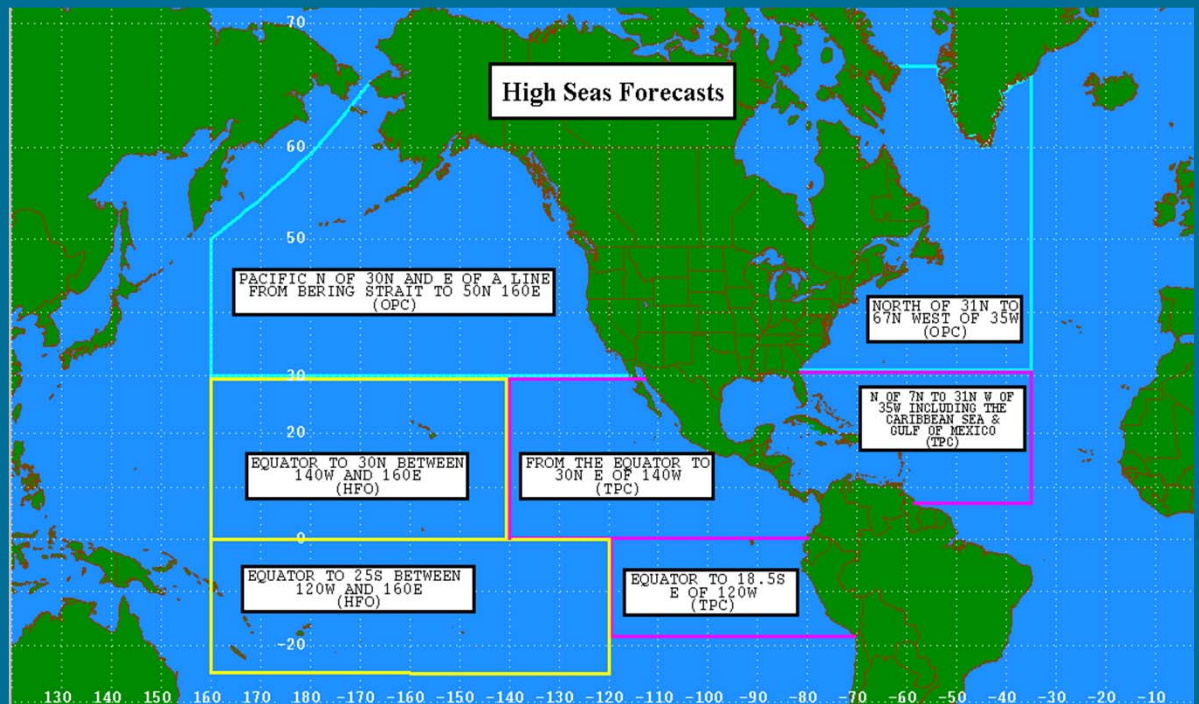

To lead the U.S. coastal and marine weather forecast and warning programs for the protection of life and property, promotion of economic benefits, and the enhancement of quality of life.

Vision

All marine customers meet their safety needs and other concerns through ready access to accurate, timely, easily understood and technologically advanced forecasts, warnings and other products.

High Seas Marine Forecasts and Warnings

- Atlantic, Pacific, Caribbean & Gulf of Mexico
 - NCEP
 - Ocean Prediction Center
 - Tropical Analysis and Forecast Branch

High Seas Graphic Forecasts extend to Europe and Asia

National Hurricane Center Tropical Analysis Forecast Branch (TAFB)

- Year round (24/7/365) products
 - Marine forecasts (graphical and text) and discussions (MIM)
 - Surface analyses and discussions (TWD)
 - Satellite-derived rainfall estimates
- Hurricane Season – 15 May – 30 November
 - Tropical cyclone intensity estimates using Dvorak technique
 - Media support to NHC (English, Spanish, French)
 - Radar tracking of tropical cyclones
 - Forecast support to Hurricane Specialists

Marine Forecast Tools

•Surface Observations

- METAR, Moored platforms (Buoy/CMAN) and Ships

•NWP Guidance

- Global Models (GFS, ECMWF, UKMET, NOGAPS)
- Regional Models (NAM, SREF)
- Global Wave Model (NWW3)

• Satellite Tools

- Geostationary (GOES 11-12-13)
- Polar Orbiting
 - Microwave (TRMM, AMSR-E, SSM/I)
 - Scatterometer (WindSAT, ASCAT)
 - ***Loss of QuikSCAT Nov 23, 2009 – Big Impact on operations***

Populate marine parameter layers in NAWIPS
for legacy marine graphics

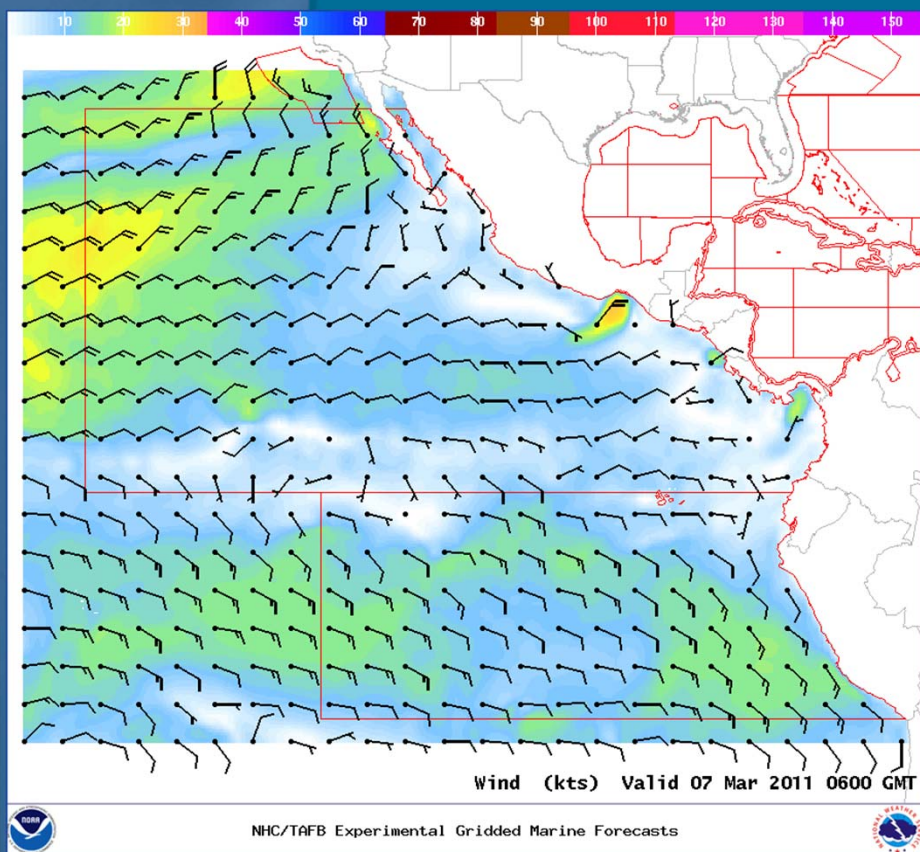

Create experimental gridded marine
Forecasts on the web

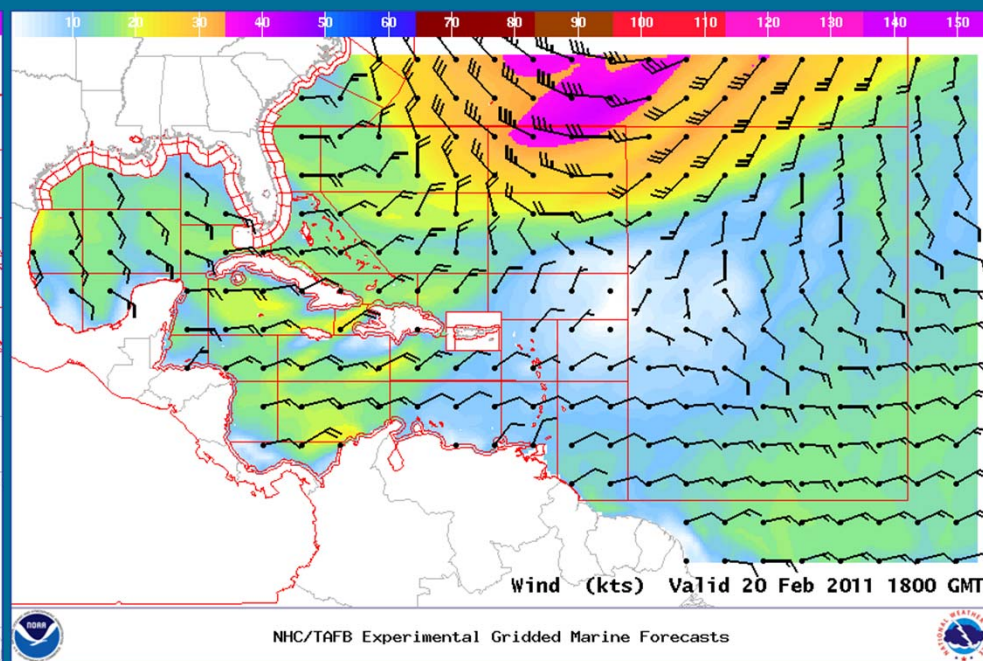

Experimental Gridded Marine Forecasts

www.nhc.noaa.gov/marine_forecasts.shtml

East Pacific

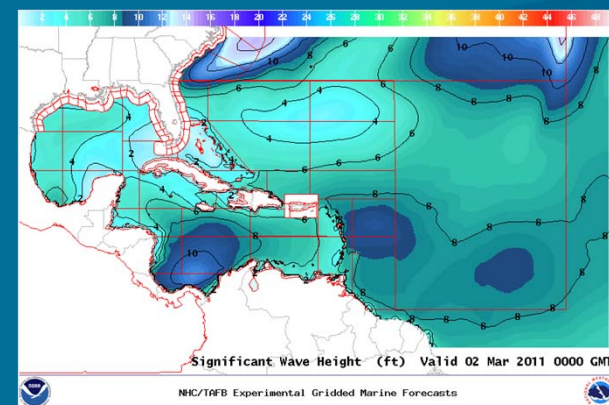

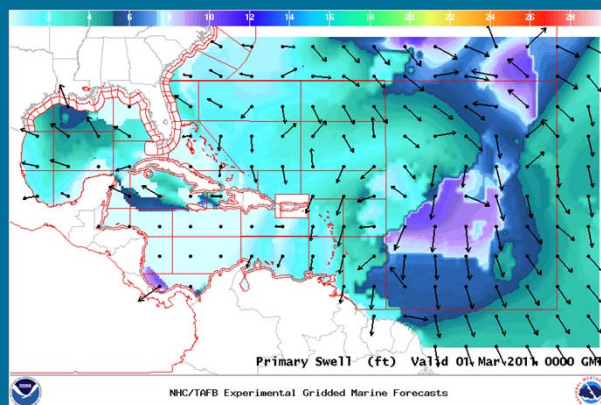

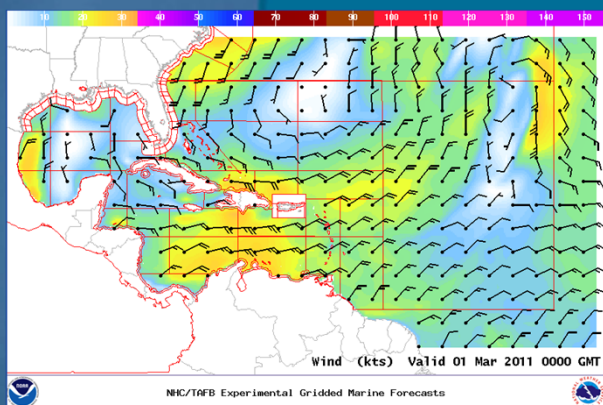

Atlantic

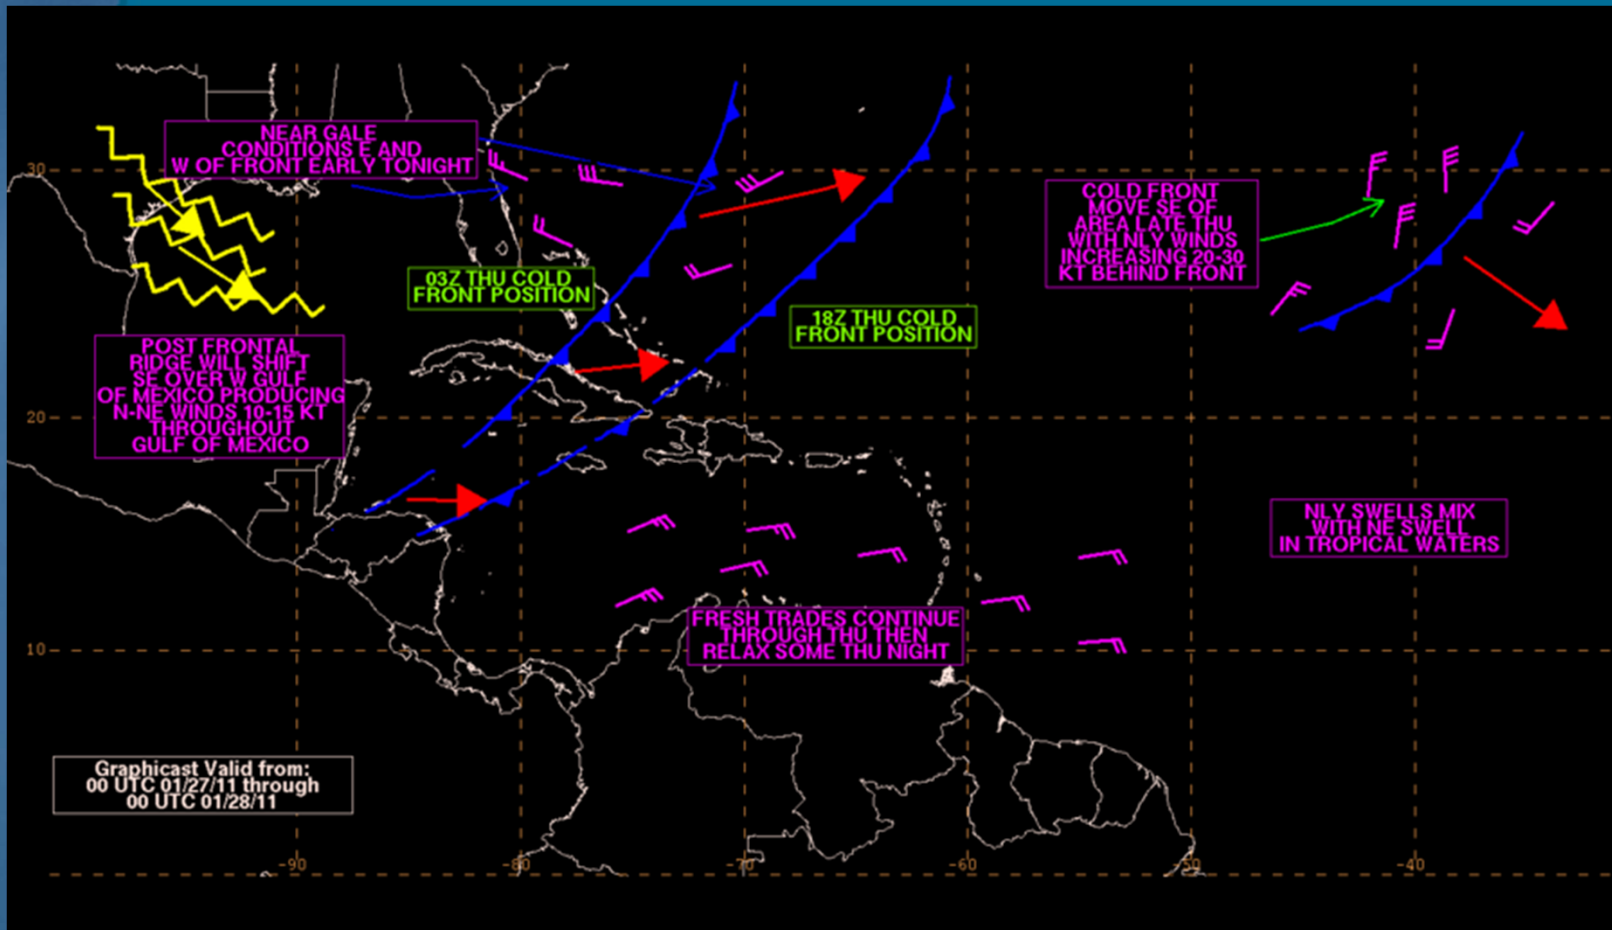

Advantages of Gridded Forecasts

- Model blending tool can be used to create ensemble of NWP solutions
- Tropical cyclone wind tool incorporates wind radii from NHC forecasts (TCM) with forecasters blending radii into the ambient wind field
- Grids used to create legacy charts to ensure forecast consistency

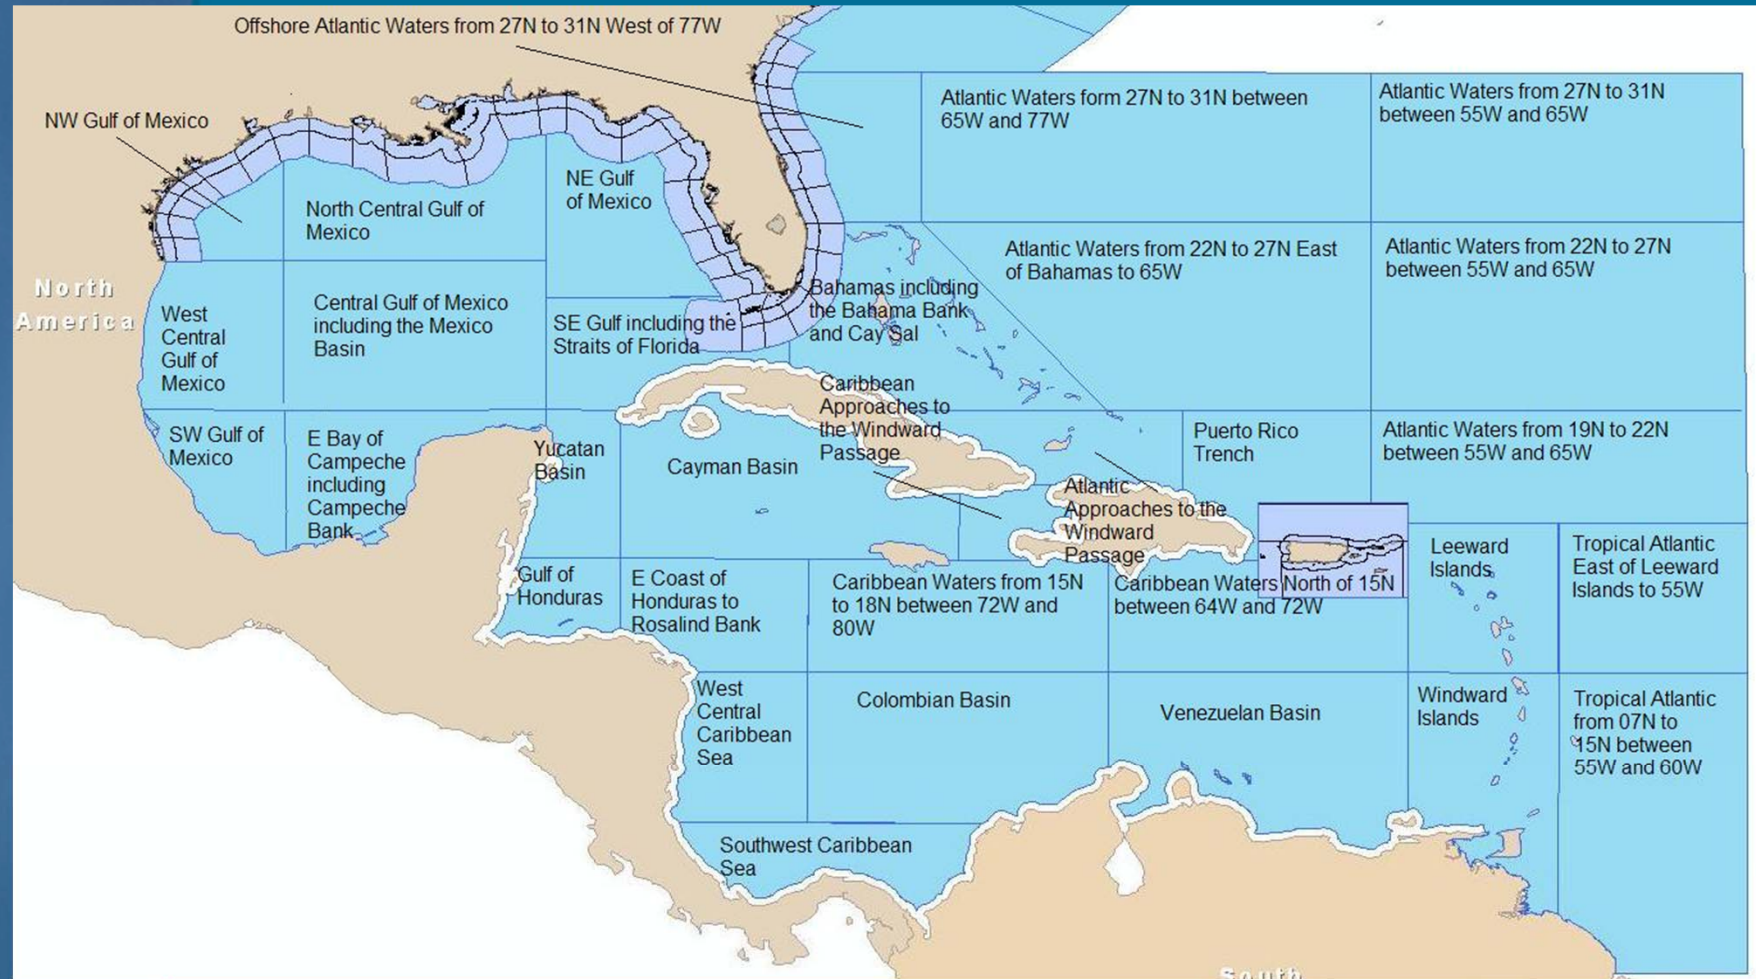

Experimental Decision Support Graphicast

- Highlights current areas of significant marine weather

New, More Detailed Offshore Marine Zones Coming Soon

Future Plans for TAFB Marine Products and Support

- 4X a day issuance of Sea State - Fall 2011
- Locally run WW3 model using NHC tropical cyclone forecasts – JHT project – Fall/Winter 2011-12
- Enhance marine products on the web
 - Point and click forecasts (MFM, Zones)
- Enhanced Decision Support Services (Local high resolution grids)
- Enhanced Ecological Support Services (HAB, Oil Spill)
- Collaborate gridded marine forecasts with International MET services

NHC Storm Surge Team

Forecasting Surge

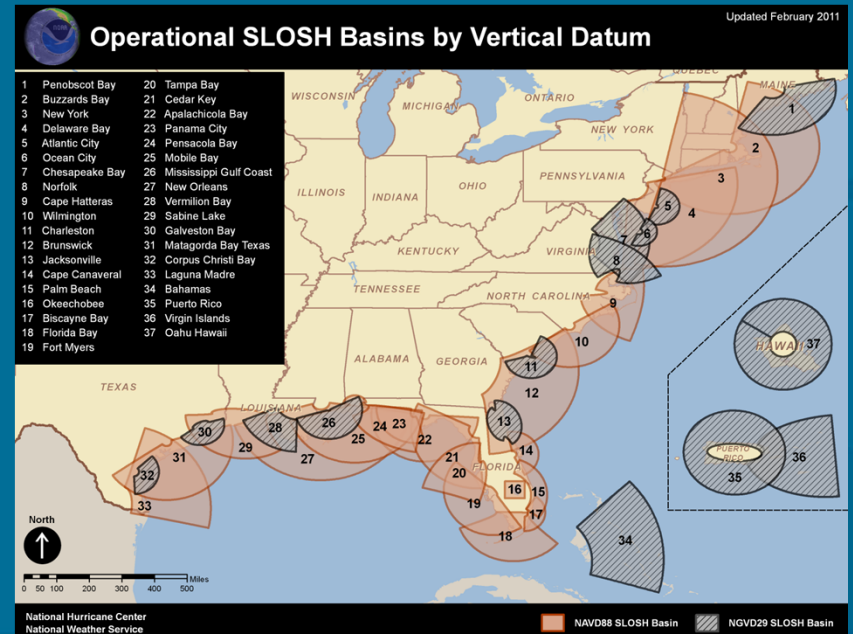

- Storm surge models are HIGHLY dependent on the accuracy of the meteorological input!!!
- Meteorological uncertainty will dominate over storm surge model specifications (physics, resolution, etc)
- Different vertical datums/reference levels
- Storm surge is only one component in the real water level rise.
 - Total water rise = surge + tides + waves + freshwater flow

SLOSH

NWS/NHC Operational Surge Model

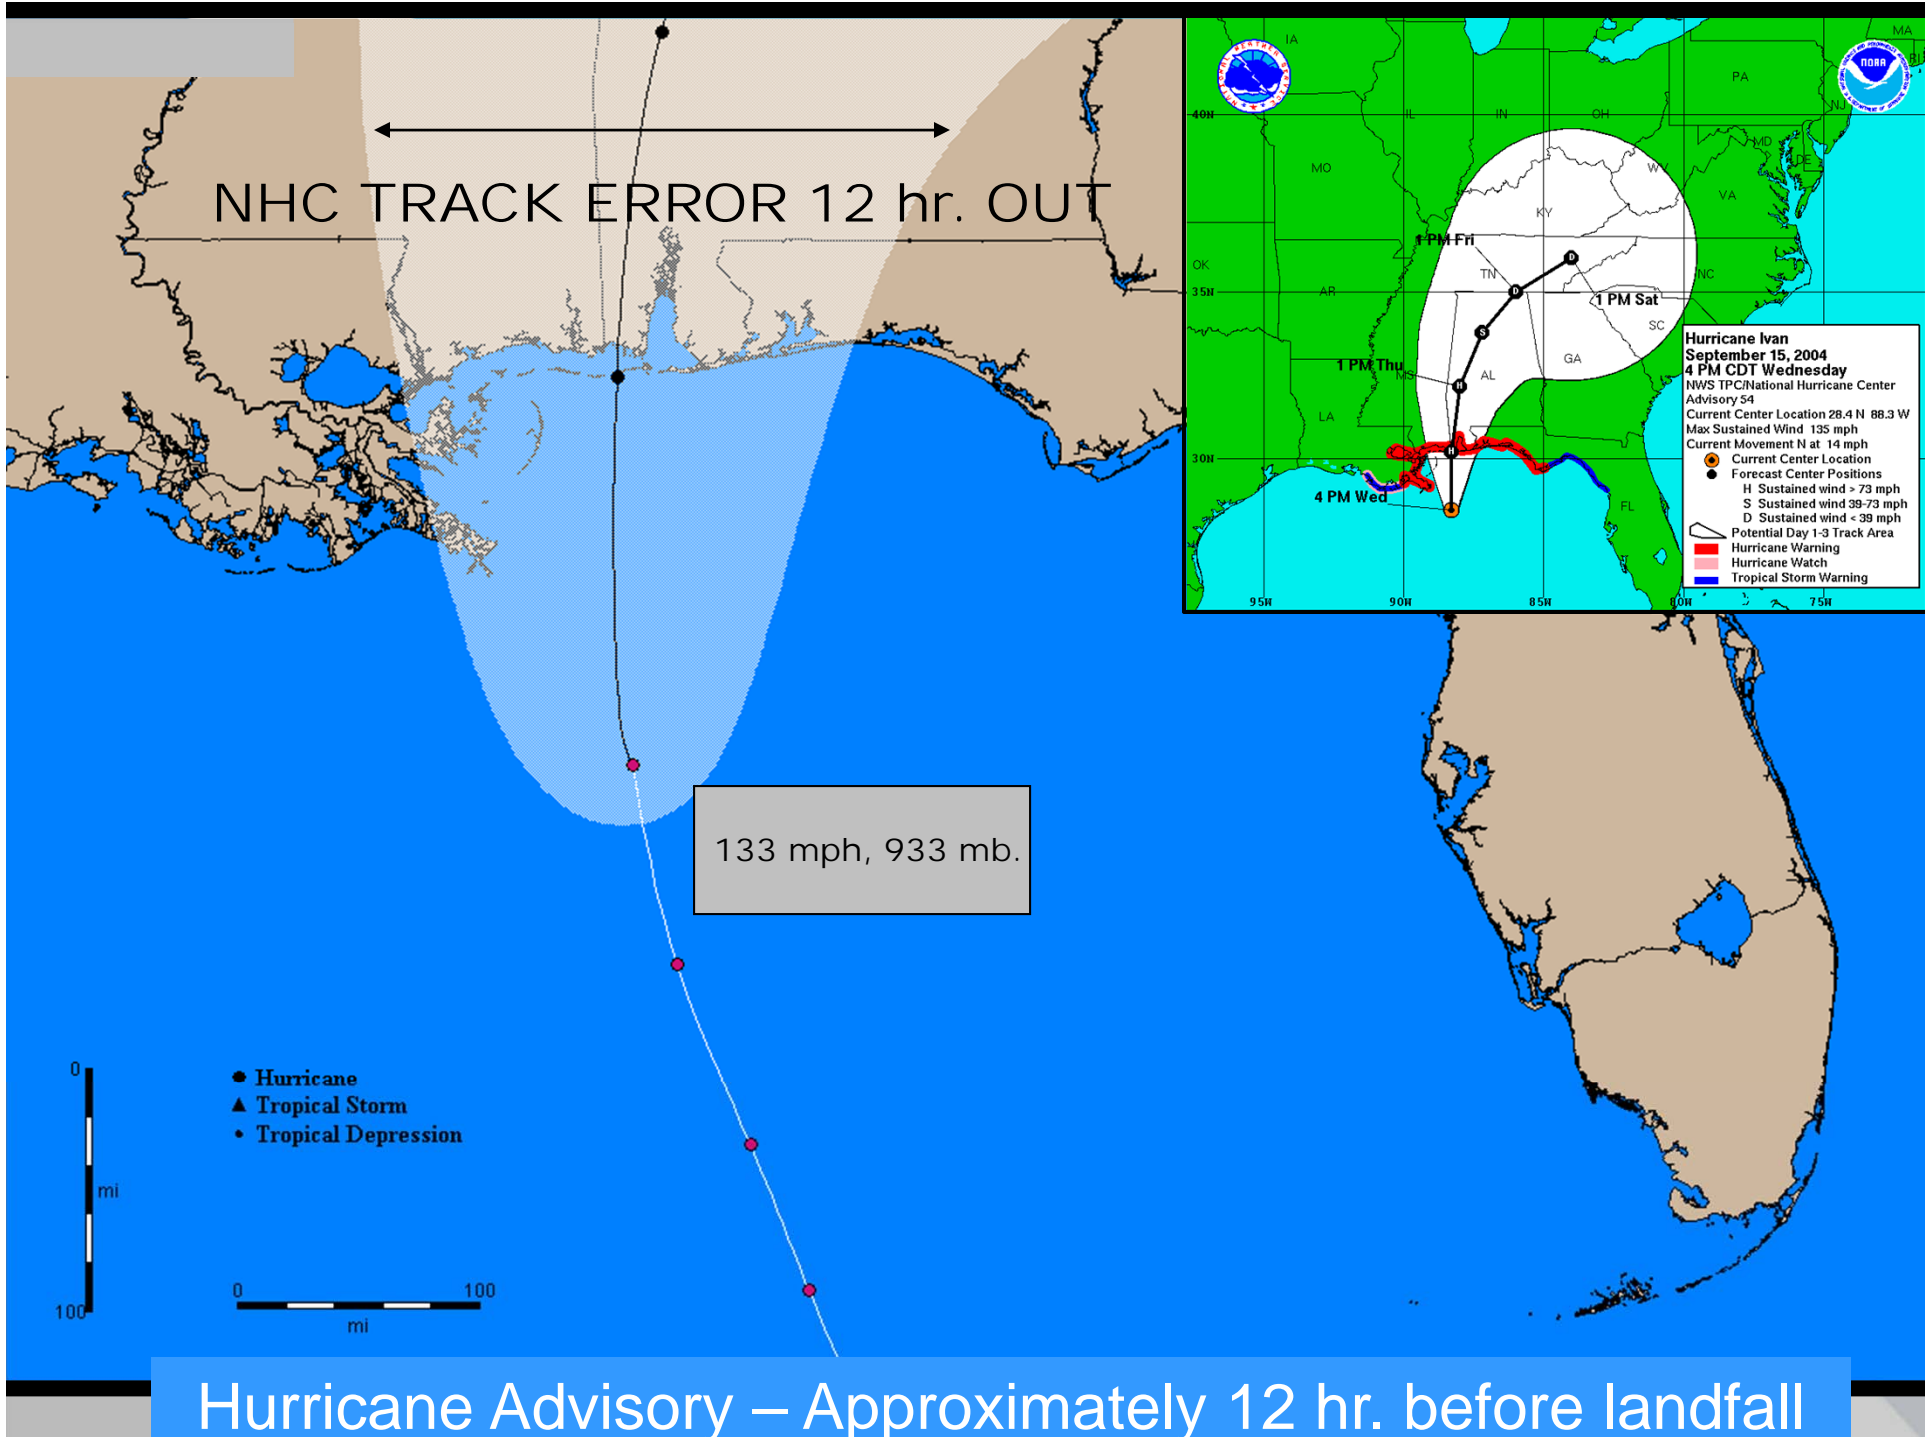

- Sea, Lake, and Overland Surges from Hurricanes
- A computerized numerical model developed by the National Weather Service (NWS) to estimate storm surge heights (and winds) resulting from historical, hypothetical, or predicted hurricanes

SLOSH

- SLOSH does include:
 - Flow through barriers/gaps/passes
 - Deep passes between bodies of water
 - Inland inundation (wet/dry cell)
 - Overtopping of barrier systems, levees, and roads
 - Coastal reflection (coastally trapped Kelvin waves)
- SLOSH does not include:
 - Breaking waves/wave run-up
 - Astronomical tide
 - Synthetic runs can be initialized at different tide levels via a static initial water level
 - Normal river flow
 - Precipitation

Surge Based on NHC -12 hr. Advisory

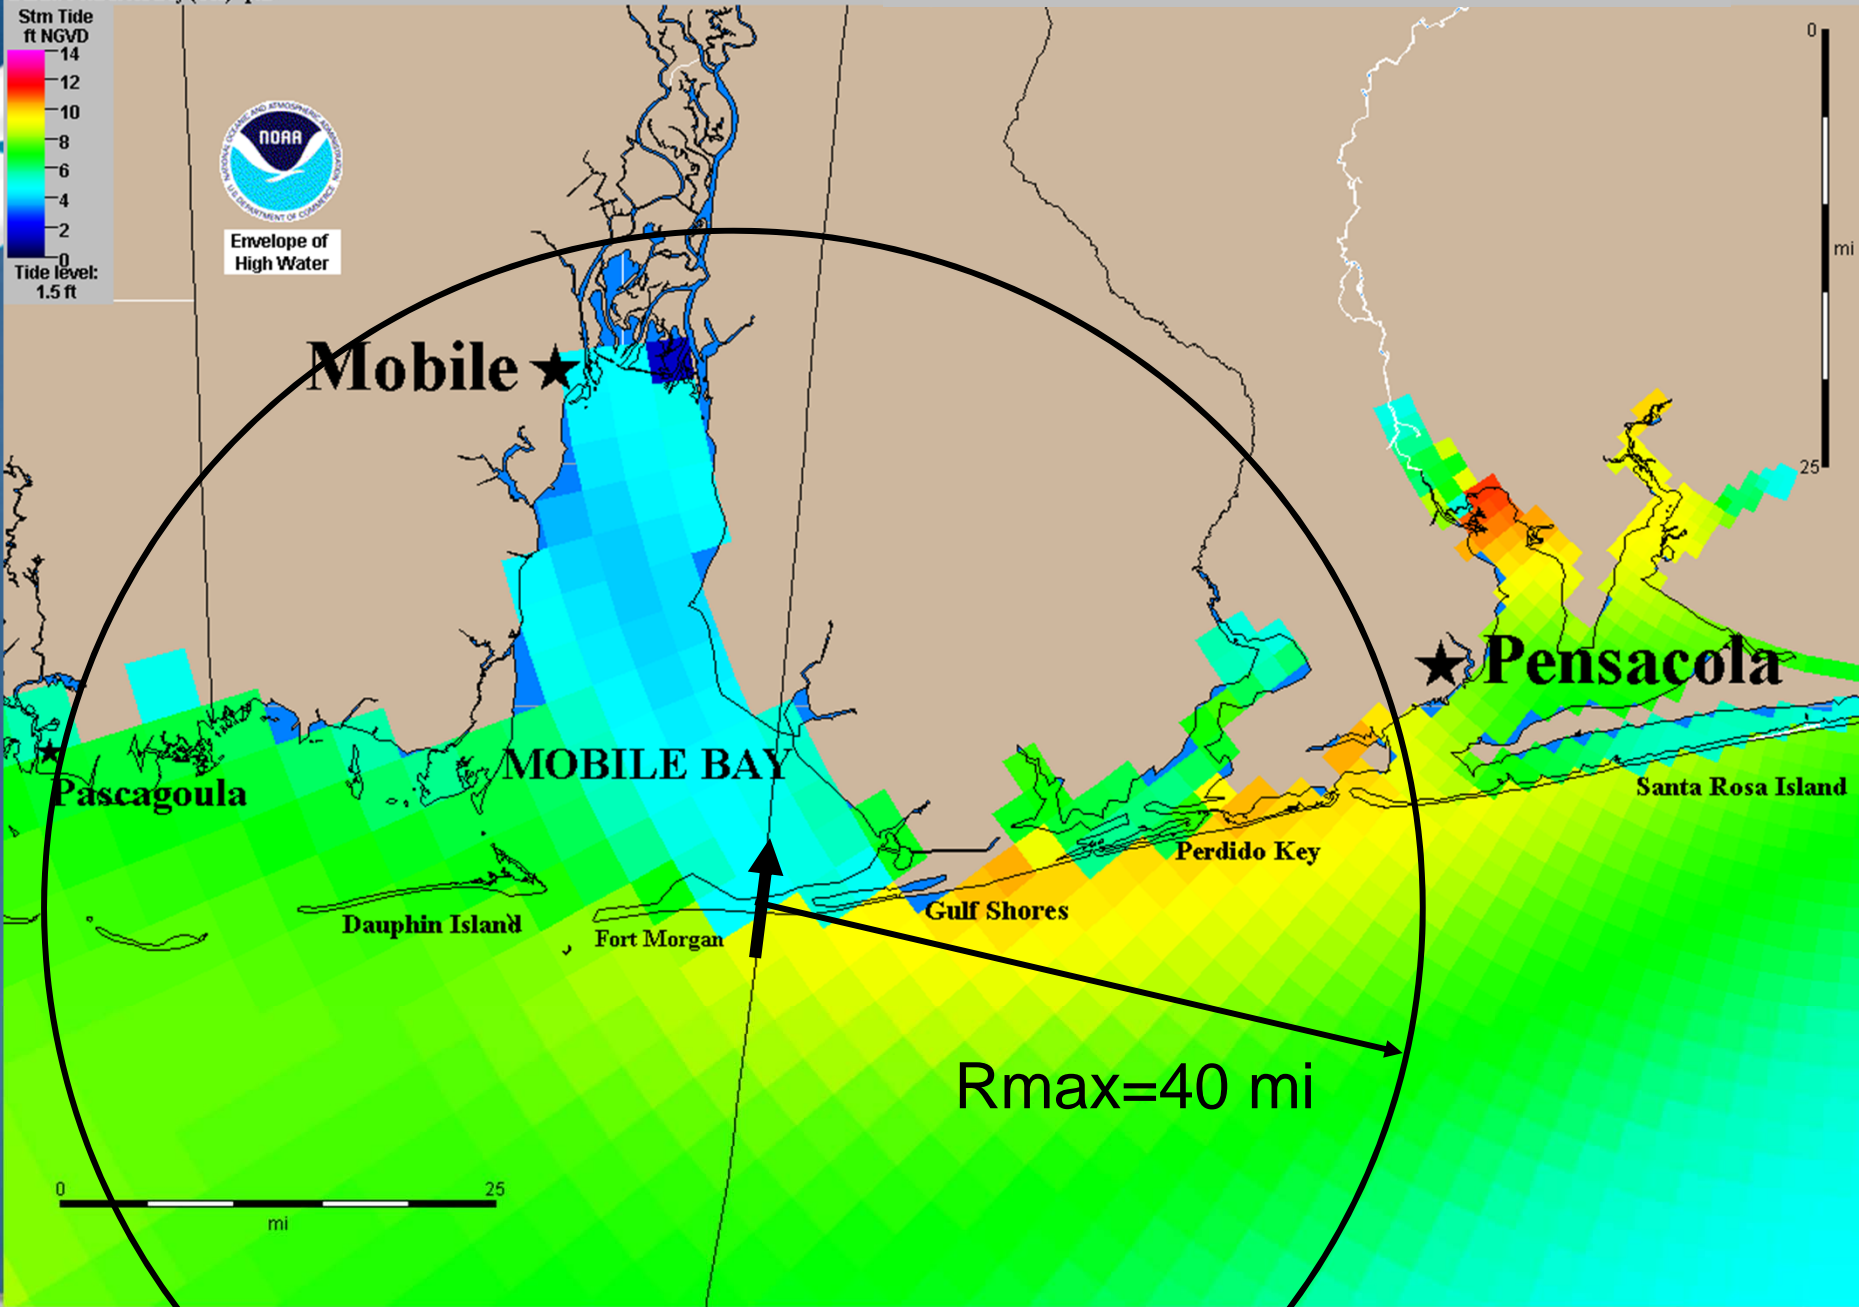

Actual Hurricane Track 30 mi. E of -12 hr. Advisory Forecast Track

Basin: Pensacola Bay (Old) <pns>

Envelope of
High Water

Surge Based on NHC Storm Best Track

Alternative to Single Runs

- Atlas of pre-computed surge maps based on:
 - Different directions of motion
 - Different landfall locations
 - Different intensities
 - Different storm sizes
 - Different forward speeds
- For example, using 3 different directions of tropical cyclone tracks, each direction with 10 parallel equally spaced tracks, 5 different central pressures, 2 different sizes, and 2 different translational speeds, would require $3 \times 10 \times 5 \times 2 \times 2 = 600$ model runs

Ensemble Products

MEOW

- Maximum Envelope of Water
- Composite of maximum storm surge heights at each grid cell using hypothetical hurricanes run with the same:
 - Category (Intensity)
 - Forward Speed
 - Landfall Direction
 - Initial Tide Levels
- Composite achieved by reviewing parallel tracks that make landfall at different locations
- Over 80 MEOWs have been generated for some basins

68W

67W

66W

Ensemble Products

MOM

- Maximum of MEOWs
- Composite of the maximum storm surge height for all hurricanes of a given category
- Disregards forward speed, landfall direction, landfall location, etc.
- Only 1 MOM per storm category

68W

67W

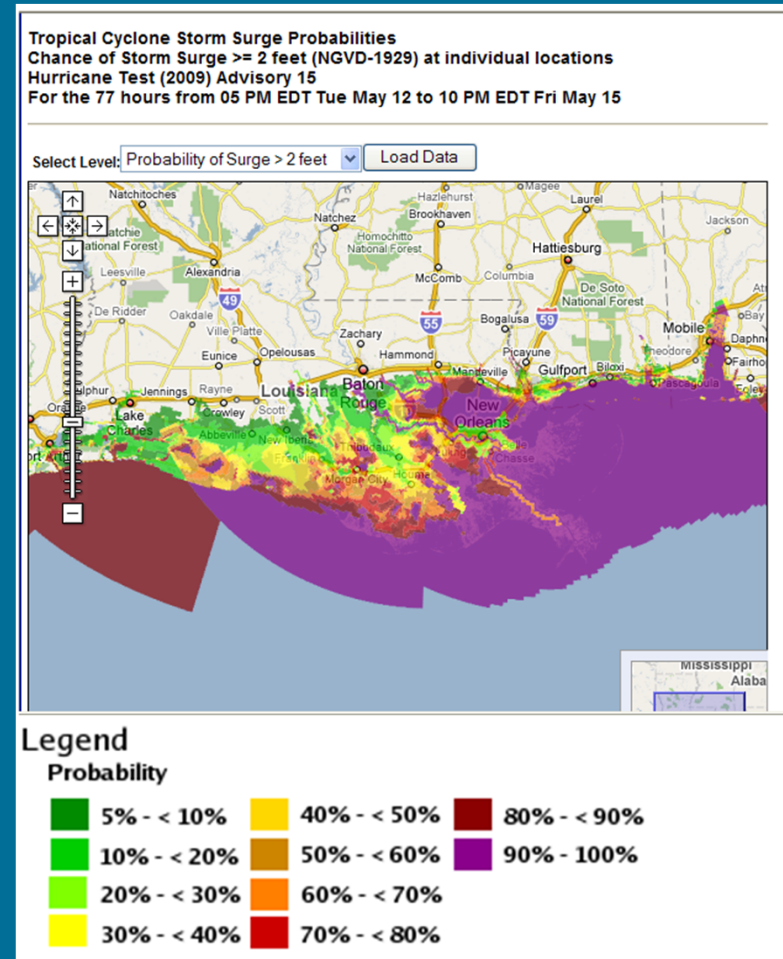

66W

Ensemble Products

Probabilistic Storm Surge

Use an ensemble of SLOSH runs to create probabilistic storm surge

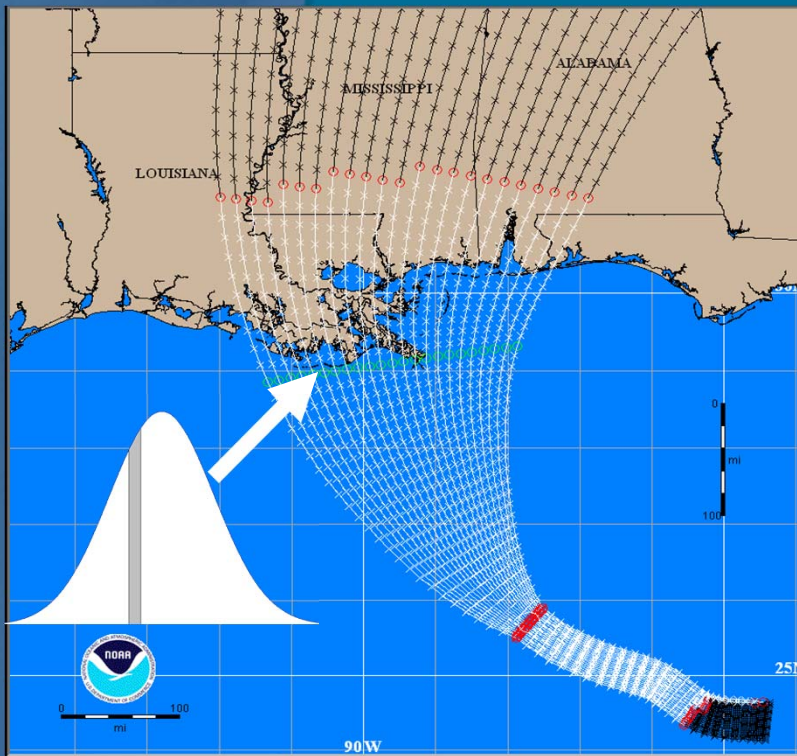

- Intended to be used operationally so it is based on NHC's official advisory
- Perturbations are determined by statistics of past performance of the advisories
- Uses a representative storm for each portion of the error distribution space rather than a random sampling
- Available whenever a hurricane watch or warning is in effect for the U.S.

Probabilistic Storm Surge

Incorporates typical track, intensity, and size errors

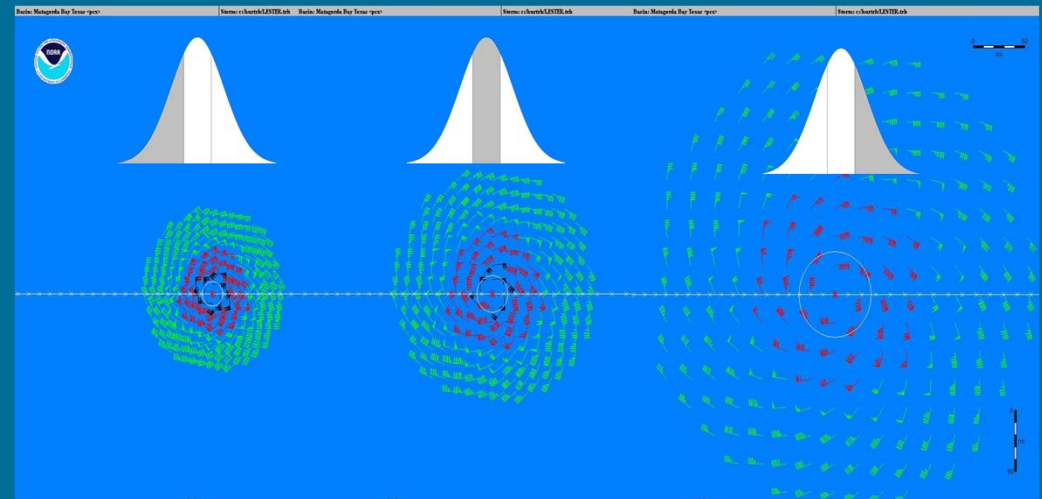

Track Uncertainty

Cross Track- left or right forecast errors

Along Track - Forward Speed: Fast (30%),
Medium (40%), Slow (30%)

Intensity & Size Uncertainty

Size: Small (30%), Medium (40%), Large (30%)

Intensity: Strong (30%), Medium (40%), Weak (30%)

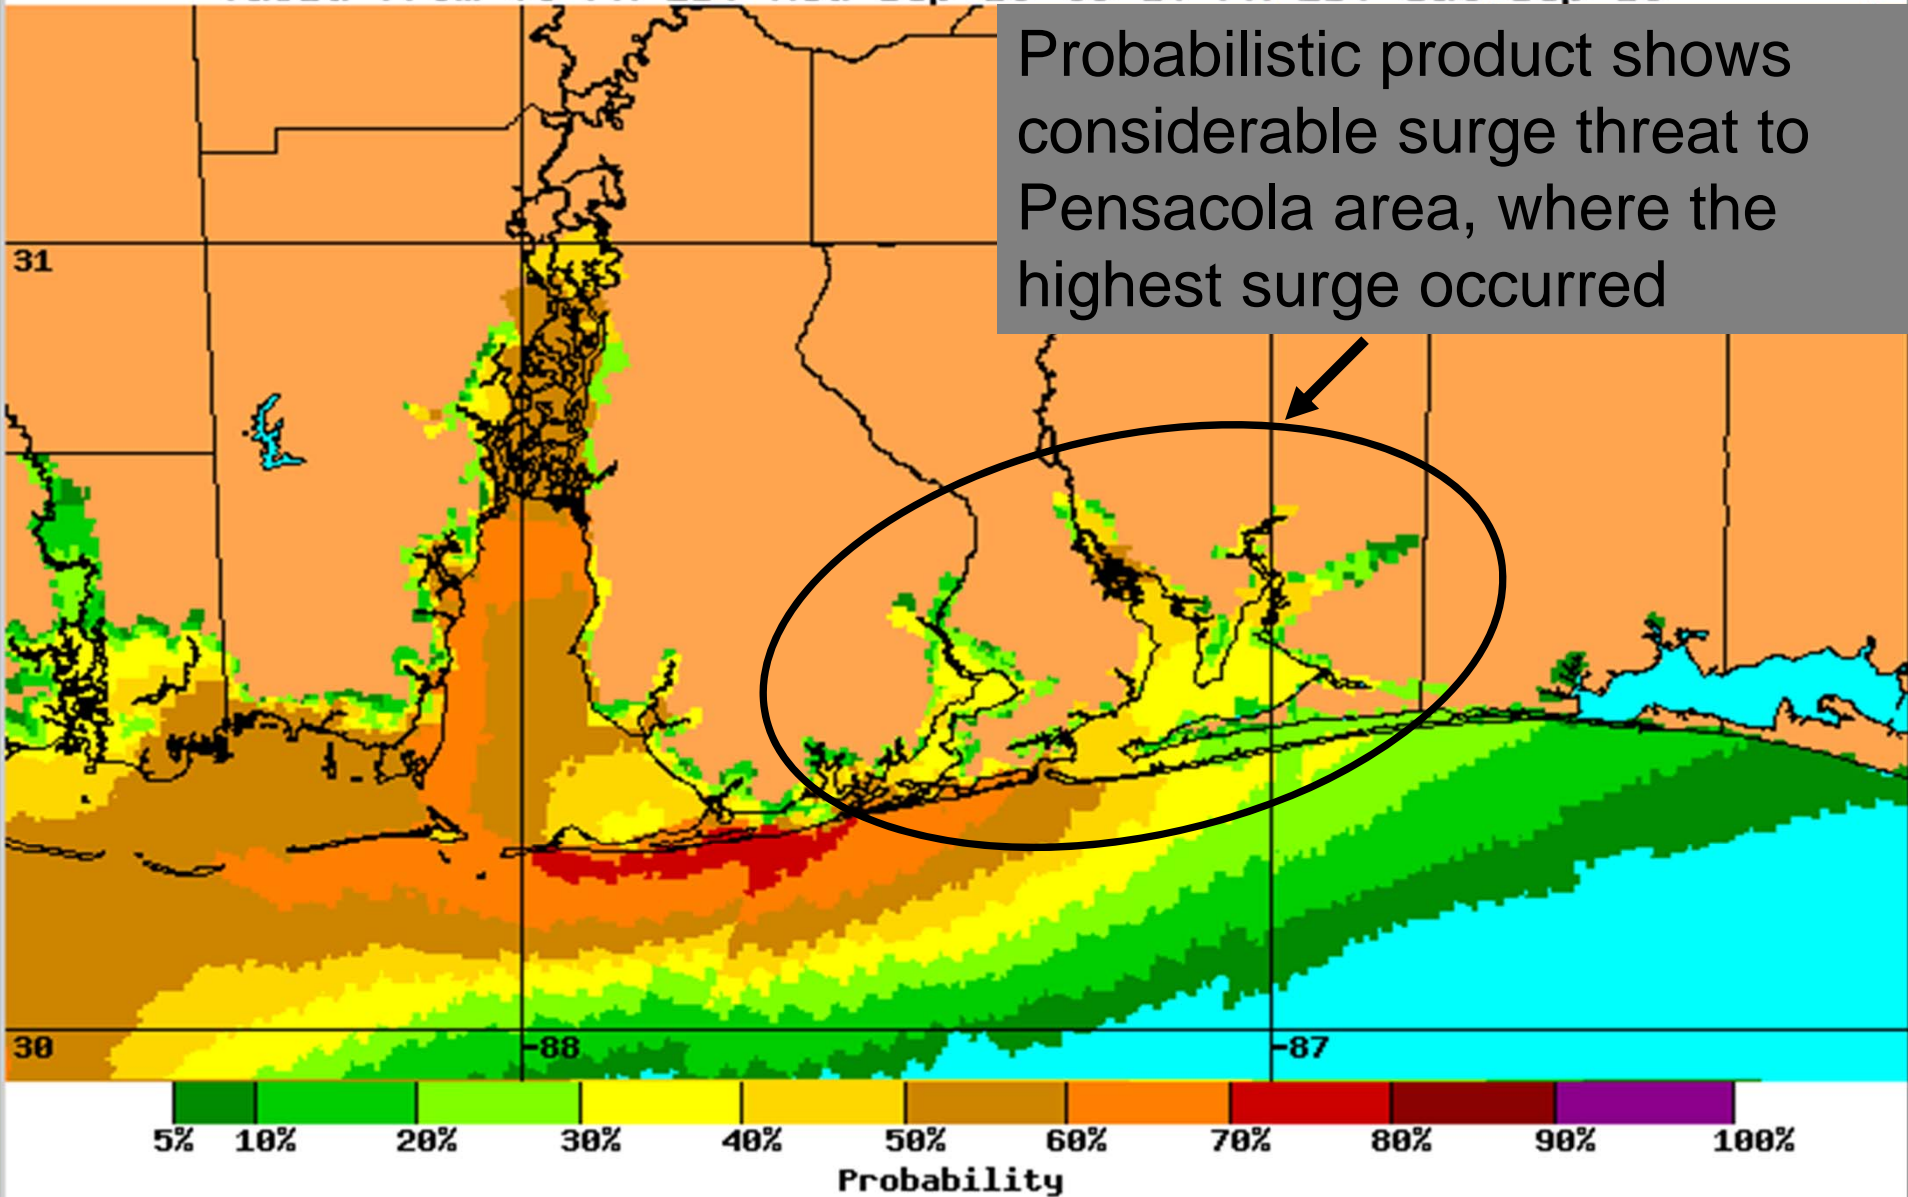

Storm: Ivan2004 Adv54 Type: Prob. of surge > 8 feet Zoom Level: Full

Experimental Tropical Cyclone Storm Surge Probabilities
Chance of Storm Surge \geq 8 feet at Individual Locations
Hurricane Ivan (2004) Advisory 54
Valid from 05 PM EDT Wed Sep 15 to 10 PM EDT Sat Sep 18

Probabilistic product shows considerable surge threat to Pensacola area, where the highest surge occurred

Height Above Reference Level

Basin: Puerto Rico v2 <sjv>

Storm: Dir wnw; Cat 3: 12 mph

Height Above Ground Level (Inundation)

Basin: Puerto Rico v2 <sjv>

Storm: Dir wnw; Cat 3: 12 mph

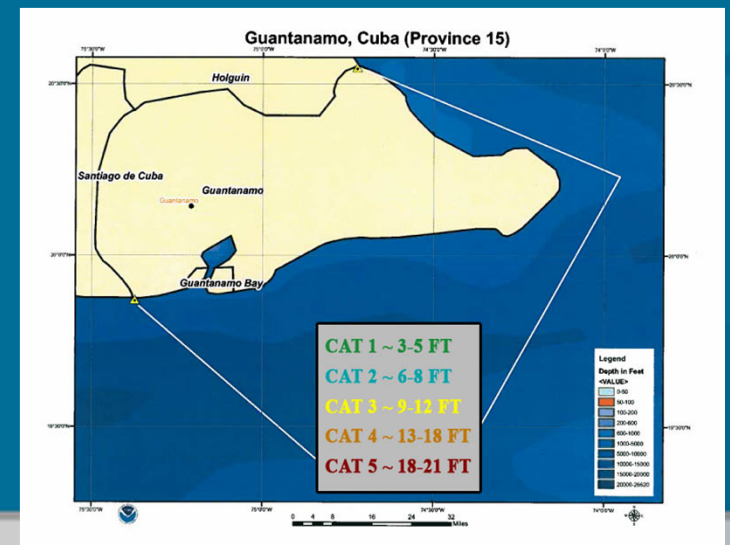

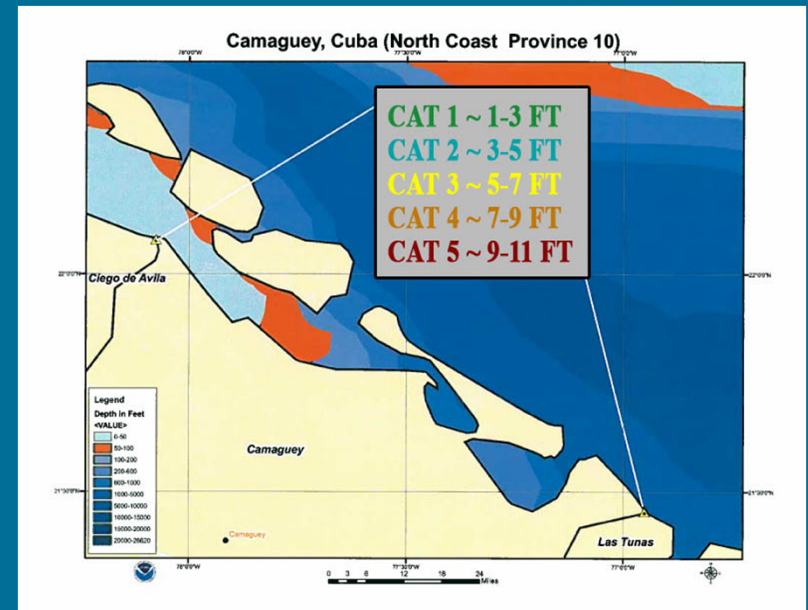

SLOSH Basins Outside the USA

- NHC has partnered with other countries to create basins outside the USA (ex. central Bahamas)
- Working on new partnership with the Government of the Bahamas to expand SLOSH coverage
- Difficult and expensive multi-year process especially if necessary (elevation) data are not available
- NHC does not currently have staffing to build basins outside the USA without additional resources

SPLASH

- Special Program to List Amplitudes of Surges from Hurricanes
- Predecessor to SLOSH
- Intended for simple storms
 - Didn't allow for sudden changes in track
 - No rapid intensification
- Intended to display surge at the coast – no inundation
- Restricted to rectangular grids

Ongoing Work

- Storm Surge (?) Warning
 - National Hurricane Center is collaborating with the local National Weather Service Offices on the idea of a storm surge warning
 - Current discussions are on the definition and issuance criteria
 - In-house (NHC) experiment likely to take place during the next year or two

Thank You!
