

Loss and risk data in Europe

Requirements from the EU working group on loss data

www.jrc.ec.europa.eu

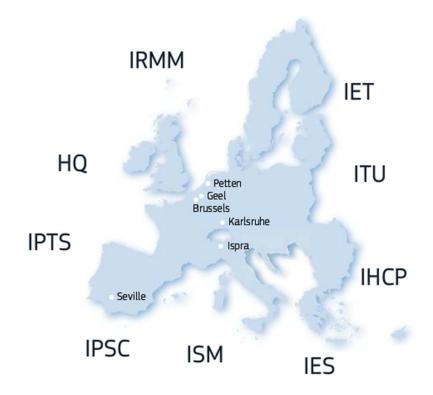

Serving society Stimulating innovation Supporting legislation

Joint Research Centre

The European Commission's in-house science service

- Policy DGs
 - ECHO: Civil Protection, DRR, Humanitarian Aid
 - DEVCO: DRR, Development
- Global Security and Crisis Management
 - Remote sensing, Modelling,
 Language processing, Statistics
 - Disaster risk assessment

Support to EU Policy

- Civil protection legislation
 - Better risk assessment and communication in EU countries
 - Disaster loss data as key indicator
- Hyogo Framework for Action
 - European Commission represents position of EU
 - New monitoring framework
 - Outcome = disaster loss data

- Other policies
 - Sustainable Development Goals
 - UN Framework for Climate Change
 - EU Resilience Agenda
 - DIPECHO
 - Good humanitarian donorship

Key issues we're focusing on

- Developing Standards
 - Disaster Identifier
 - Peril types
 - Human loss indicators
 - Economic / damage loss indicators
- Handling of uncertainty

- Sustainable implementation
 - Business case that works in EU
 - Legislation options
- Use cases
 - DRR
 - Accounting
 - Modelling

JRC and IRDR

Contribution to IRDR with knowledge on state of the art in the EU

Turn IRDR standards and practices into EU standards and

practices

European Commission and UNISDR

 Contribution to UNISDR indicator framework with knowledge on state of the art in the EU

10 July 2014

Situation in Europe

10 July 2014

...revealed so far (2014 June)

Active in loss recording Planning loss database

Active in loss recording but no contacts

Main differences

- Data structure
- Methodology/standard used
- Mandated organizations
- Hazard types covered

Important similarities

- At least municipality scale
- Sectorial

...sometimes there is even more than one initiative within a country, usually not related, to serve different application areas (governmental, academic, insurances, ...)

Disaster loss data are key for DRR

Loss Data is important for DRR

- Carnegie meeting 2012
- Global Platform for DRR
- EU-US dialogue

Existing initiatives

- CRED EM-DAT
- UN: UNDP, UNISDR (GAR)
- IRDR Loss Data WG
- Insurance industry
- PDNA, DALA

Loss data for DRR: accounting

- Prioritize DRR actions
- Assess effectiveness of DRR

Loss data beyond DRR

- Risk modelling
 - Validation and calibration
- Forensics
 - What went wrong?
- Accounting
 - Risk transfer, Solidarity Fund, etc.

EU Working Group on Loss Data

- Study of Commission: opportunities and challenges in EU context
 - Report of JRC
- EU Working Group
 - Participating beyond EU
 - Joint meetings with IRDR
- Roadmap
 - 2014 State of the art document
 - 2015 Guidelines for EU

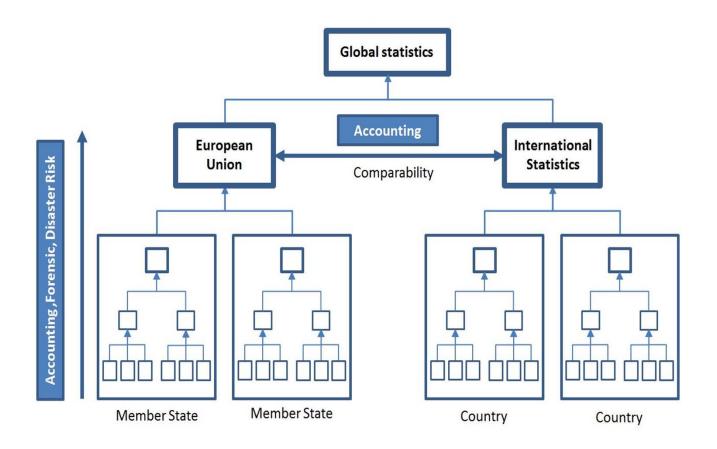

Applications: more than accounting

Motivation **Loss Accounting** Disaster forensic Risk modeling Objectives Recording of impact Identifying the cause Model future losses Measuring trends Learn from past DRR and mitigation Local Local policy (City mayor) Local expert teams Local research/policy National users National policy National research/policy National expert teams (National administration) (Regional GEM) International policy International initiatives Global users (UN, Donors, HYOGO, GAR) International expert teams (GEM, GAR) **EU** policy (PDNA) **EU** policy (DG ECHO)

EU: internal processes + interoperability with intl.

Conceptual Model: a tool for establishing a standard

Application Areas

- Accounting
- Forensics
- Risk modelling

Scope of loss databases

- Local, municipal
- Regional
- National
- Global

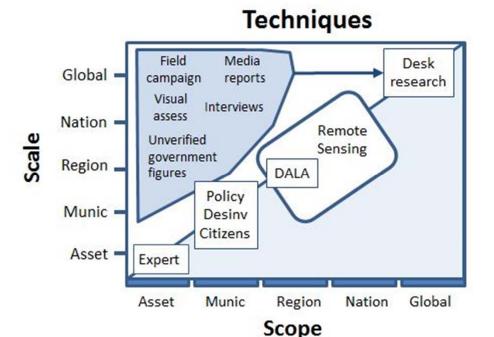

Scale of loss assessment

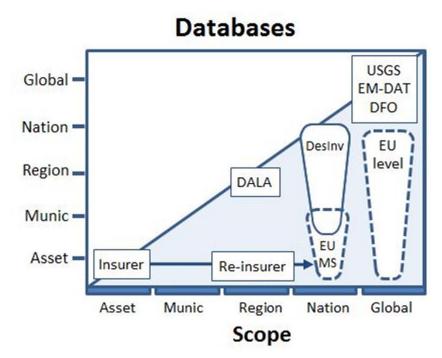

- Local: field campaigns, citizens
- Regional: dedicated orgs, remote sensing
- National: desk research
- Global: desk research, media monitoring

Tool for framing discussion, ambitions, technology and existing work

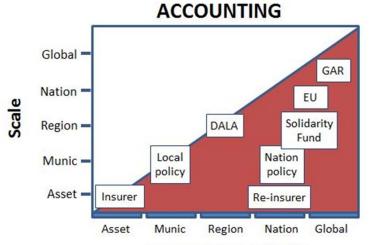

Scale (precision) and scope (coverage)

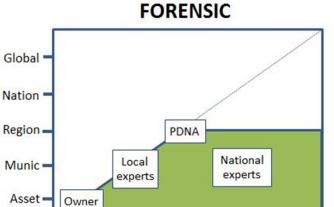

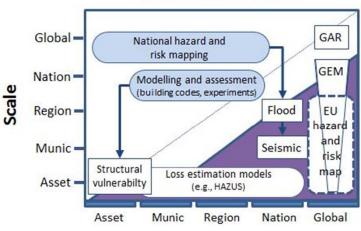

Requirements for application areas

RISK MODELLING

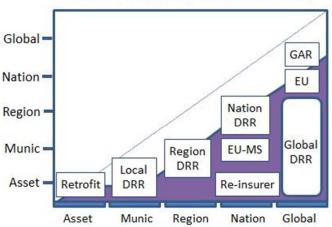

Nation

Munic

Asset

10 July 2014 14 Scope Scope

Technical Standard: essential elements

- Principle: refer to existing relevant standards
- Loss data has three parts
 - Hazard: what caused the loss?
 - Record enough information for aggregation + linking to specialized db
 - Affected element: what was affected?
 - Must be developed strongly for most application areas → difficult
 - Loss: what is the damage and/or the loss?
 - Damage versus loss

10 July 2014

Dimensions: Sectorial, Loss-bearer, Time/space

Standard

Data element		Standards or best praction	ces to be considered			
Hazard event	Geographical information	Country code (ISO 3166-1 alpha-3 specification)				
identification		Minimal spatial unit (NUTS classification - LAU2 level)				
		Coordinates (latitude, longitude) of point or polygon				
	Temporal information	Event date and time: UTC time (h)				
		Period: start date (dd/mm/yyyy) - end date (dd/mm/yyyy)				
	Hazard event classification	INSPIRE - HazardCategoryValue				
		EM-DAT disaster classification				
	Event type specific attributes	Small set of severity indicators (e.g. like in GDACS) for search purposes				
	Hazard event identification number	Modified GLIDE number, used to	link to more detailed hazar	d databases		
Affected elements	Georeferenced exposed element	Country code (ISO 3166-1 alpha-3 specification)				
		Minimal spatial unit (LAU2)				
		Coordinates (latitude, longitude)				
	Characteristics	General	Loss/Damage		Tangible	Intangible
		Hazard dependent			Tanglale	intangue:
Loss indicators	Name of data field	Damage/loss category	categories			
describing	Value of data field	Value	Direct damage	Physical dama	age People	Cultural heritage
damage/loss of		Physical unit	to exposed elements	to property	0	Natural environment
exposed elements	Time stamps	Date (dd/mm/yyyy) of entry and	to exposed elements	to property	directly affected	Natural environment
		Date of measurement and validi	Indirect loss/damage	Loss of flow	, People	Loss of future usage
		options for time dependent field			indirectly affected	(agriculture, forestry, tourism,)
	Source and source type	Types: Official emergency mana	Tatal lass/damass	Economic los	Affected seconds	
		institutions, Academic and Scien				Economic loss/number-size of assets
		institutions, Media releases	Common denominator	Monetary val	ue Number of persons	<u>-</u>
	Uncertainty	Methodology to describe uncertainties. Reliability of sources (different p	* * * * * * * * * * * * * * * * * * * *			

Standard: aggregation

Asset level		
exposed elements:		
individual assets		
[physical units]		
buildings (non/residential)		
content/equipment

10 July 2014

Joint Research Centre

Standard: sharing data

- Sharing principles based on INSPIRE
- Vision
 - standard data model, encompassing local to global scales
 - Implementation of sub-components, depending on scale/scope
- EU level

10 July 2014

- MS: have own system, or can use standard implementation (JRC)
- Aggregation of MS data at EU level
- Quality control to avoid bias

Implementation scenarios in existing MS contexts

	Scenario Local	Scenario Regional	Scenario Hazard/Sector
Mandated organisation	Local civil protection	National / Regional loss assessment centres	Hazard specific or sectorial national authorities
Strengths	Real time, Local, Citizens involved	Consistency, Complex assessments	Consistency, Hazard data / sector data
Weaknesses	Change of procedures	Not complete data, New centres needed, Citizens not involved	Training for loss, Bias towards hazard/sector, Citizens not involved
Cost	Low	Medium	Medium
Benefit	High	Medium	High
Loss accounting	High utility	Medium utility	High utility
Forensics	Medium utility	Medium utility	Low utility
Risk modelling	High utility	Low utility	High utility

Conclusions

Working group for recording loss database provide

- a technical framework of the conceptual model
- different levels at which a standard can be developed
- guidance to Member states for implementation,
- harmonisation of the loss data at international level
- sharing principles
