What Do We Call Flash Floods

WORLD METEOROLOGICAL ORGANIZATION (WMO):

“ A flood of short duration with a relatively high peak discharge ”

AMERICAN METEOROLOGICAL SOCIETY (AMS):

“ A flood that rises and falls quite rapidly with little or no advance warning, usually the result of intense rainfall over a relatively small area ”

A local hydrometeorological phenomenon that requires:

1. BOTH Hydrological and Meteorological expertise for real time forecasting/warning
2. Knowledge of local up to the hour information for effective warning

*Usually, flow crest is reached within **6 hours** of causative event
(Only consider < **2000km²**).*

Natural Causes of Flash Floods

- Intense rainfall from *slow moving* thunderstorms or tropical systems
- Orographic rainfall in *steep* terrain
- Soil *saturation or impervious* land surfaces
- Hydraulic *channel* properties
- Sudden release of impounded water
(natural dam or human-made dam)

The Need

Flash Floods are very significant disasters globally ...

- Highest number of deaths per people affected

... **BUT** there are no discernible trends for loss reduction

- No flash flood warnings for vast populated areas of the world
- Lack of local expertise and of regional cooperation
- Little in situ data in small regions
- Large-river flood-warning strategies ineffective for flash floods

Large River Flooding vs. Flash Flooding

LRF

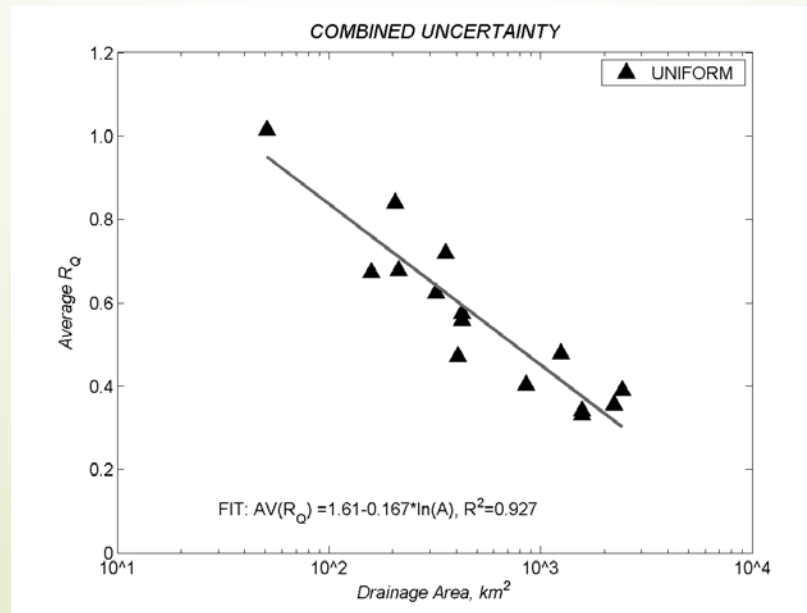

- *Catchment response affords long lead times*
- *Entire hydrographs can be produced with low uncertainty with good quality data*
- *Local information less valuable*
- *A hydrologic forecasting problem primarily*
- *Affords time for coordination of flood response and damage mitigation*

FF

- *Catchment response is very fast and allows very short lead times (< 12hrs)*
- *Prediction of occurrence is of interest*
- *Local information is very valuable*
- *A truly hydro-meteorological forecasting problem*
- *Coordination of forecasting and response is challenging over short times (Careful Planning Needed)*

Operational Approaches for Flash Flood Warning

1. Site Specific (data rich catchments with special forecast interests)
2. Area-wide modeling with remotely sensed data and global datasets
 - 2a. Flash Flood Guidance (data sparse regions for public watches and warnings of flash flood occurrence)
 - 2b. Full Distributed Hydrograph Modeling (in regions with good data when entire hydrographs are needed) (High Uncertainty on smaller scales)

5 BASINS
3 LOCATIONS/BASIN
27 EVENTS/LOCATION

Importance of Soil Water on Flash Flooding in addition to rainfall rate

Example from south-central United States – Summer Convection

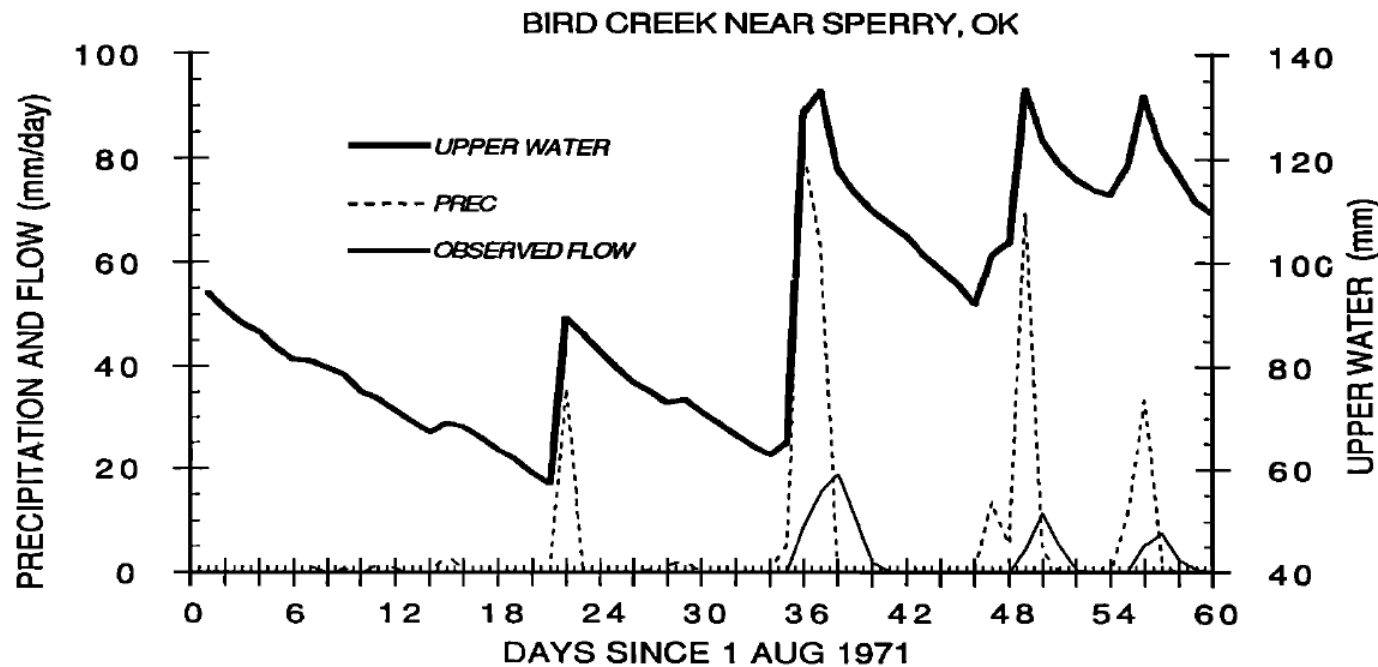

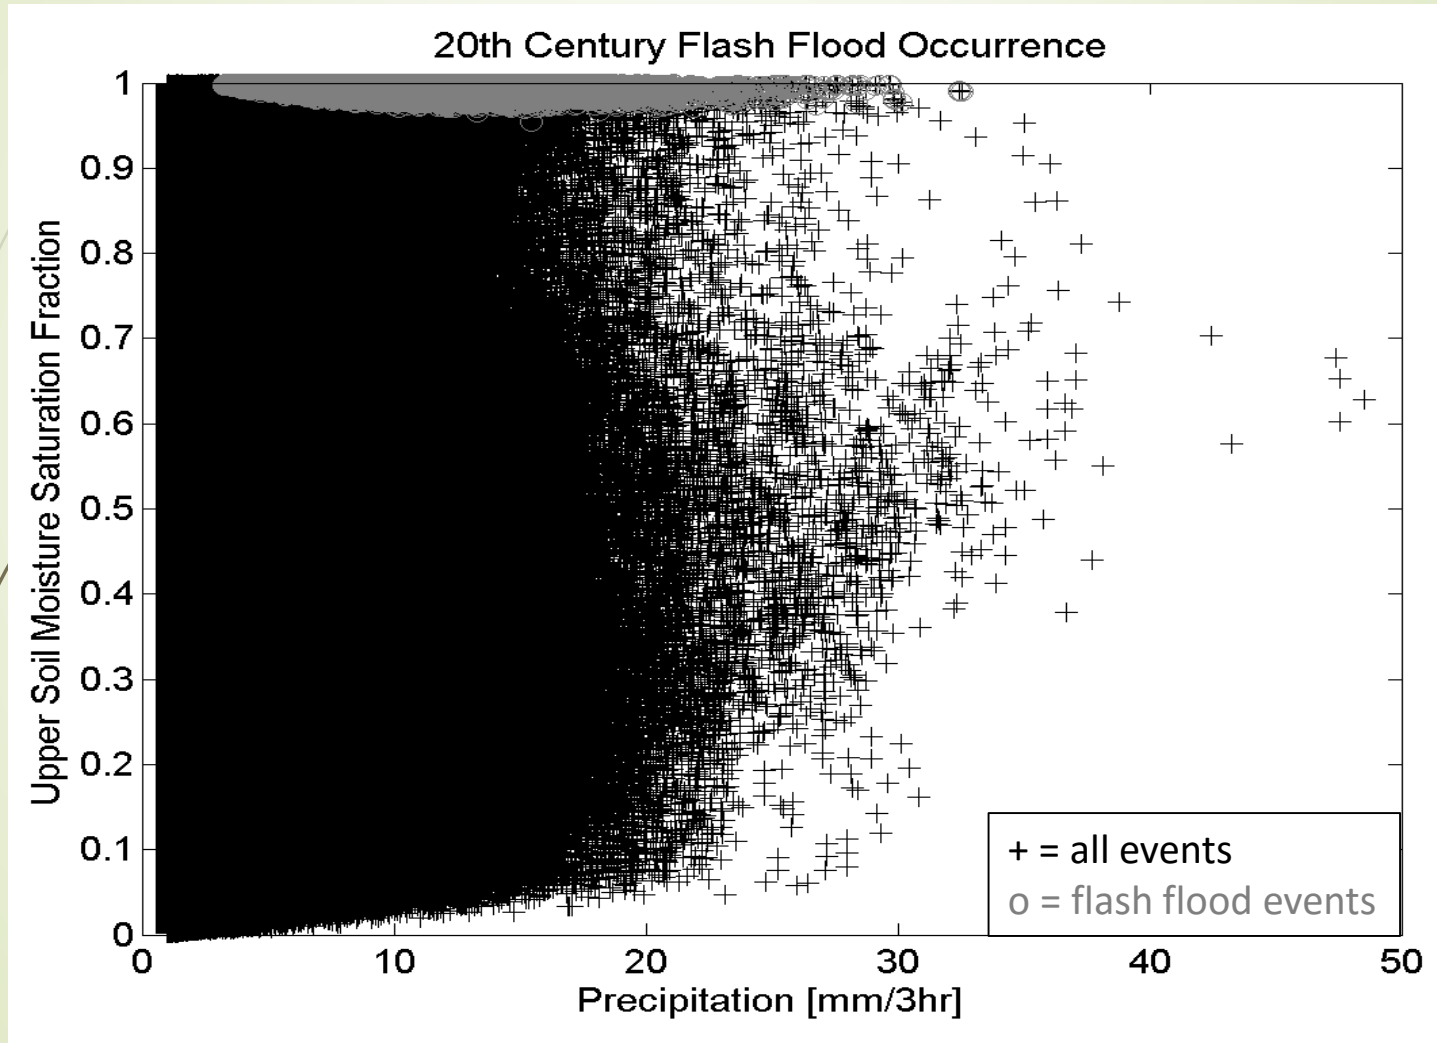

Figure 2. Daily values of rainfall rate (dashed line), flow rate (solid line), and upper soil water (heavy solid line) for Bird Creek near Sperry, Oklahoma, for August and September 1971. Rainfall and flow rates are in millimeters per day and are read on the left ordinate axis. Upper water is in millimeters and is read on the right ordinate axis. Upper water capacity is 135 mm.

Georgakakos et al.
WRR 31(3), 210-220,
1995.

Importance of Soil Water on Flash Flooding in addition to rainfall rate

Example from southwestern United States – Winter Mediterranean Rain

Modrick & Georgakakos
JHRS 3, 312-336, 2015

Examples of Soil Texture and Infiltration Rates

FIGURE 12:8. Monoliths of profiles representing four soil orders. The suborder names are also shown (in parentheses). Note the spodic horizons in the Spodosol characterized by humus (h) and iron (ir) accumulation. In the Alfisol is found the illuvial clay horizon B_{2t}. The thick dark surface horizon (mollic epipedon) characterizes both Mollisols. Note that the zone of calcium accumulation (C_{ca}) is higher in the Ustoll, which has developed in a dry climate.

Profile	Depth (cm)	Horizon Description	Upper Limit Infiltration Rate (cm/day)
RP-1	10	A/B	5,760
	40	C/Bt Clay in fractures	26
	80	C/Bt Clay in fractures	19
RP-2	40	Bt ₂	9
	80	Cox/t Saprolite with clay in fractures	55
RP-3	40	Cox/t Saprolite with clay in fractures	180
	80	Cox/t Saprolite with clay in fractures	160
RP-4	10	Bw/C Disturbed horizon	14,400
C-1	10	Bt	60
	120	Saprolite	180
	300	Saprolite	85
C-2	50	Bt	85

Harmon, R.,S., (ed.) 2005: The Rio Chagres, Panama. Springer, The Netherlands.

**Maximum Daily Rainfall Observed:
187 cm/day – Reunion Island**

Soils can infiltrate significant precipitation rates and amount.

FFG Fundamental Concepts

Flash Flood Guidance (FFG): defines the amount of **rainfall** of a given duration and over a given catchment that is just enough to cause **flooding conditions** at the outlet of the draining stream

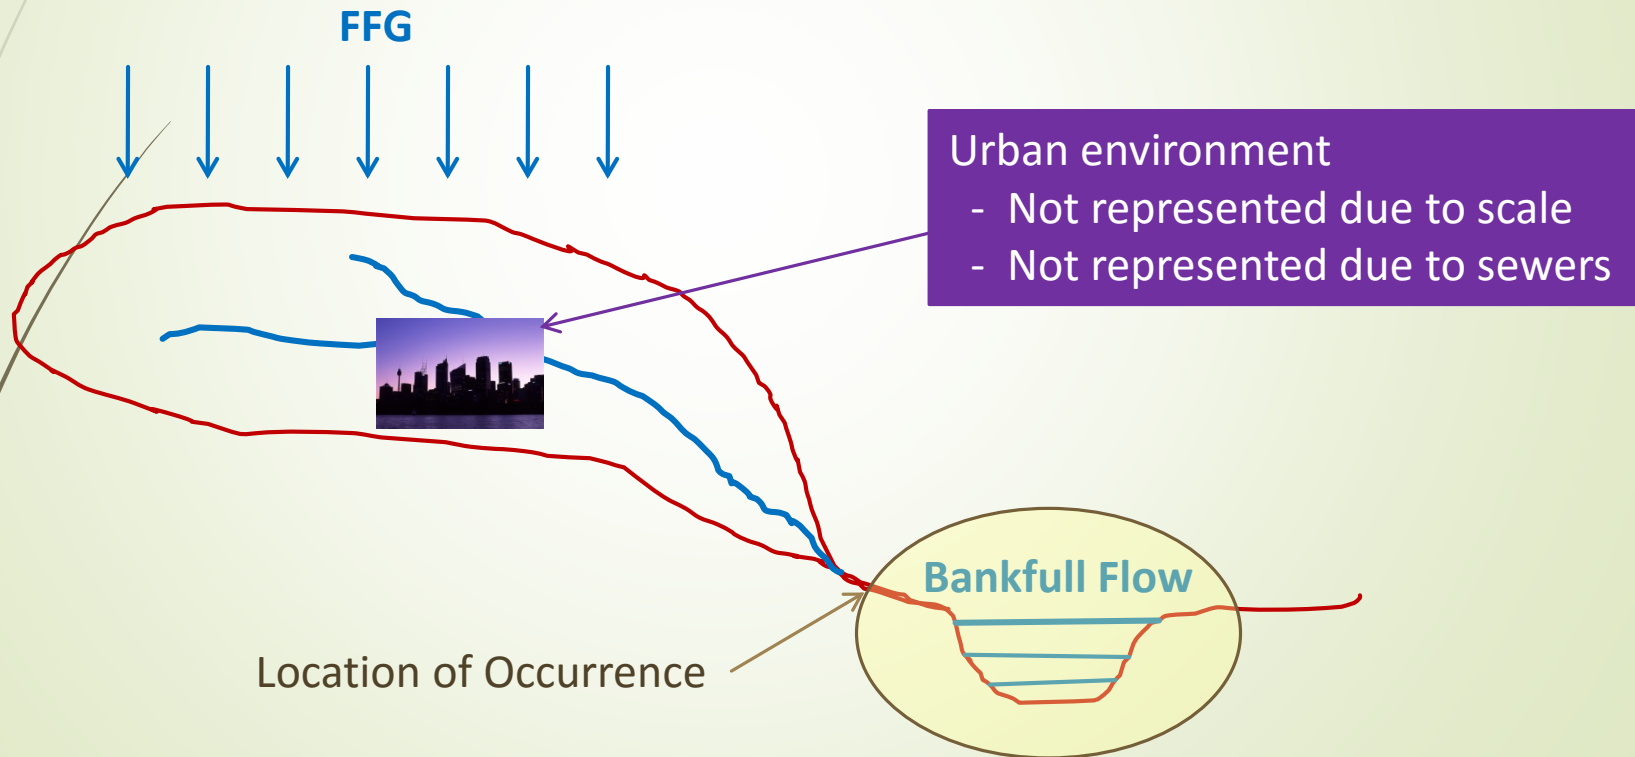

- Rainfall Threshold (familiar concept)
- Considers
 - Soil Water Deficit
 - Channel bankfull storage
- Only Bankfull flow (conservative)

Threshold exceedance concept to estimate occurrence only!

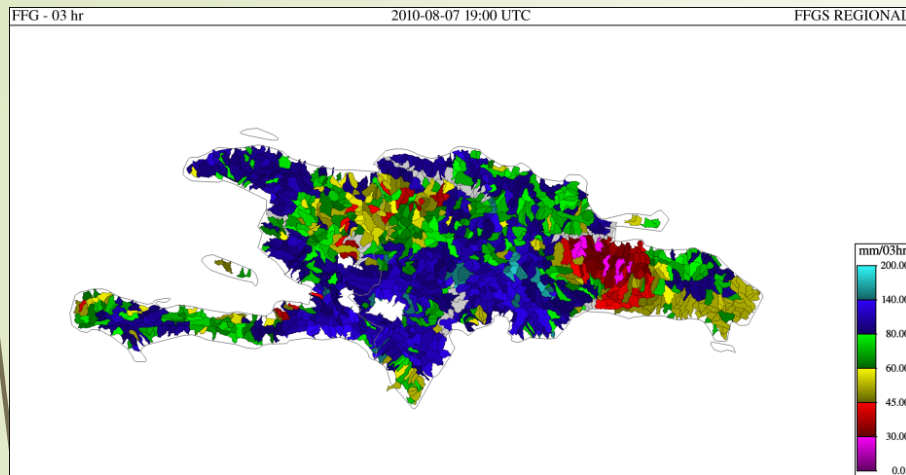

FFG Fundamental Concepts

Flash Flood Guidance (FFG): defines the amount of **rainfall** of a given duration and over a given catchment that is just enough to cause **flooding conditions** at the outlet of the draining stream

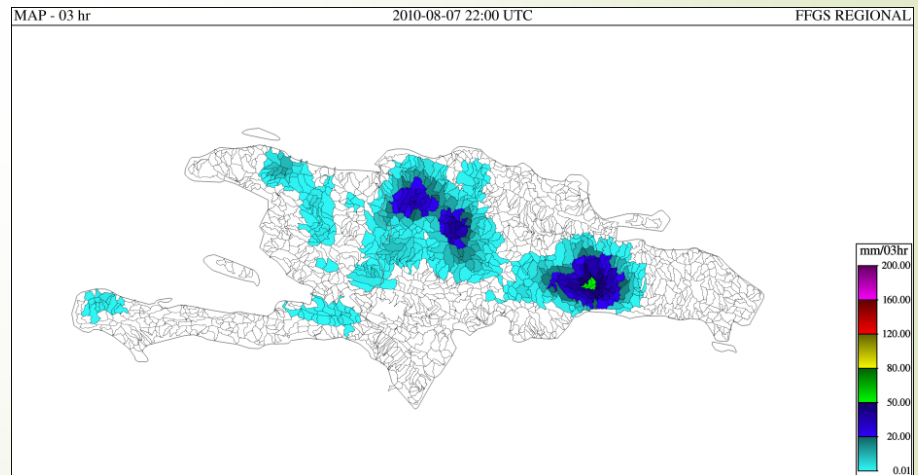

Threshold exceedance concept to estimate occurrence only!

Regional Application of Flash Flood Guidance

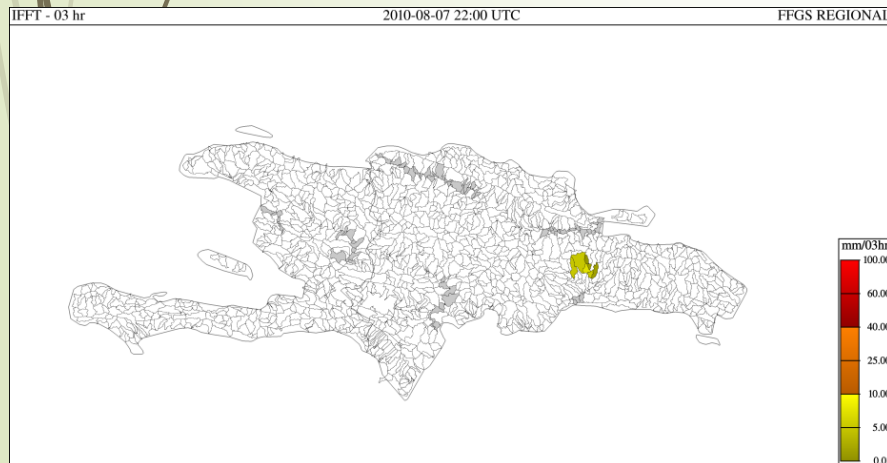

(1) Current Estimate of FFG for small watersheds

(2) Compare with precipitation (obs or forecast)

(3) Identify areas with $P > FFG$

[Example of the HDRFFG System]

The Global Initiative for Flash Floods

The **Hydrologic Research Center (HRC)** has signed a joint Memorandum of Understanding to implement regional flash flood guidance systems worldwide with:

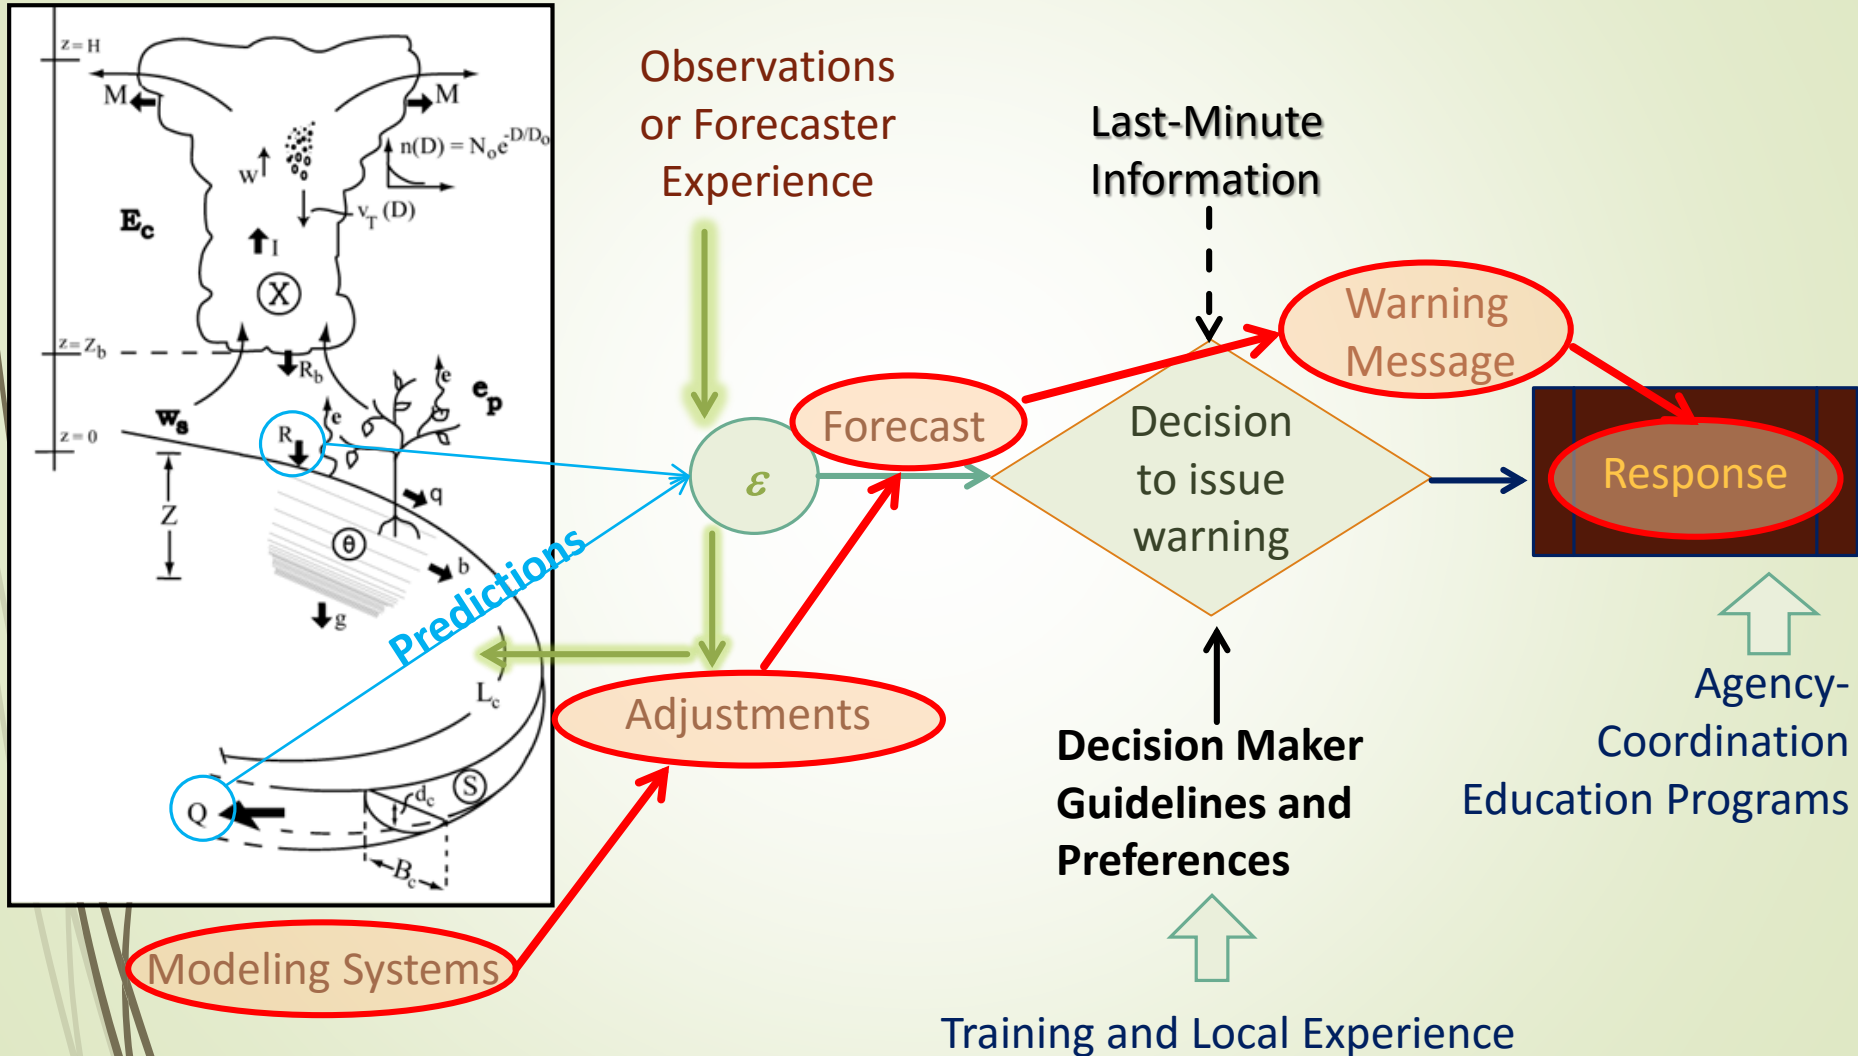

the United Nations – World Meteorological Organization (WMO)

the U.S. Agency for International Development/Office of U.S. Foreign Disaster Assistance (USAID/OFDA)

and the U.S. National Oceanic and Atmospheric Administration (NOAA).

http://www.wmo.int/pages/prog/hwrrp/flood/ffgs/index_en.php

Integrated Systems for Real-Time Warning

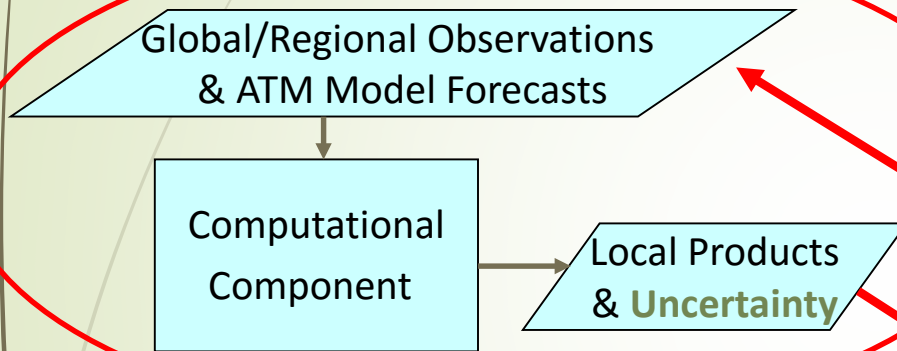

FFG Research and Development History

- ❑ **1970-1988:** US NWS Produces **FFG statistically** for each River Forecast Center. Also, **research** in adaptive site specific FF prediction systems.
- ❑ **1988-1993:** IIHR/HRC develop **physically consistent FFG formulations based on GIS** and create the first operational codes for US NWS
- ❑ **1993-2005:** HRC continues **research** in various aspects of the FFG process and system (sparsely gauged basins and uncertainty issues, forcing and models). The development of **prototype regional systems** using FFG is proposed and accepted in work plan of **WMO CHy Working Group on Applications (2002-2003)**
- ❑ **2004:** The **Central America Flash Flood Guidance System becomes operational** (serves 7 countries in CA)
- ❑ **2008:** WMO, USAID, NOAA, HRC sign a quad-part Memorandum of Understanding to collaborate in the development of a global flash flood guidance system (currently in second 5-year phase)
- ❑ **2012:** Begin development for South Asia Regional System

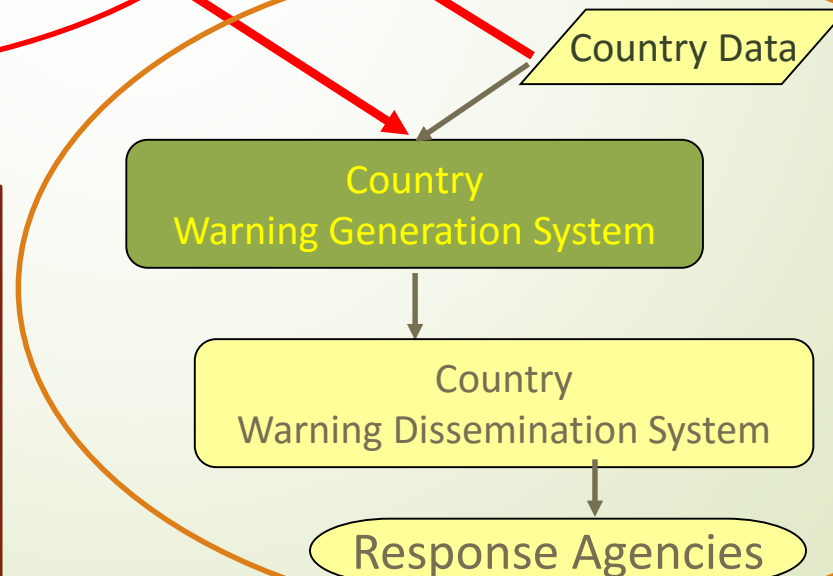

Flash Flood Guidance Systems

From Global Data and Regional Hydrometeorology to Country Data and Warnings

Regional Center: Computational Core

Country NMHS: Adjustments and Warning Core

Decisions are made with multiple datasets and under uncertainty.

There is a need to modify the products of the regional system by country forecasters and have capability for estimating consequences to local flash flood potential.

Introduction to FFGS Products

Flash Flood Guidance System Forecaster Interface

FFGS forecaster interface was designed to provide visual overview of current (and historical) system products. [Example of the BSMEFFG System]

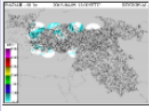

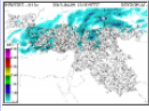

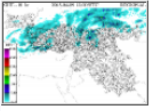

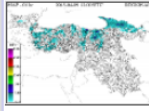

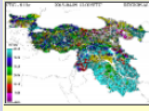

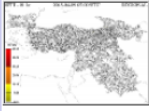

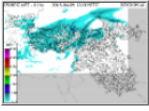

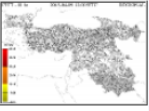

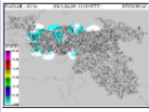

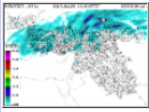

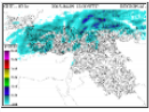

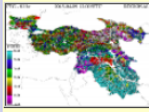

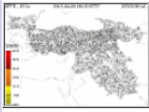

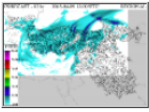

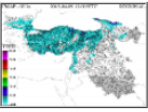

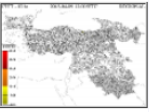

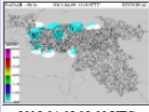

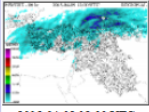

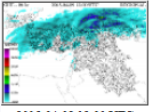

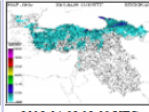

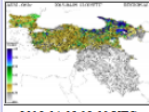

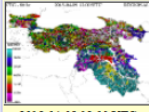

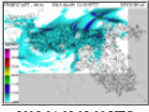

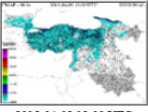

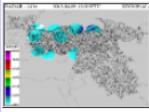

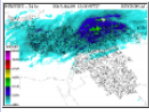

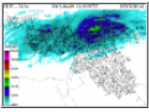

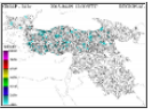

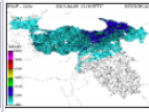

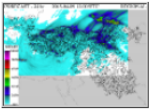

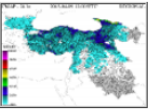

BSMEFFG - Black Sea Middle East Flash Flood Guidance System

ASM

Average Soil Moisture (ASM) product provides an estimate of current soil water in the upper soil depth, expressed as a fraction of saturation, based on hydrologic modeling of soil water content.

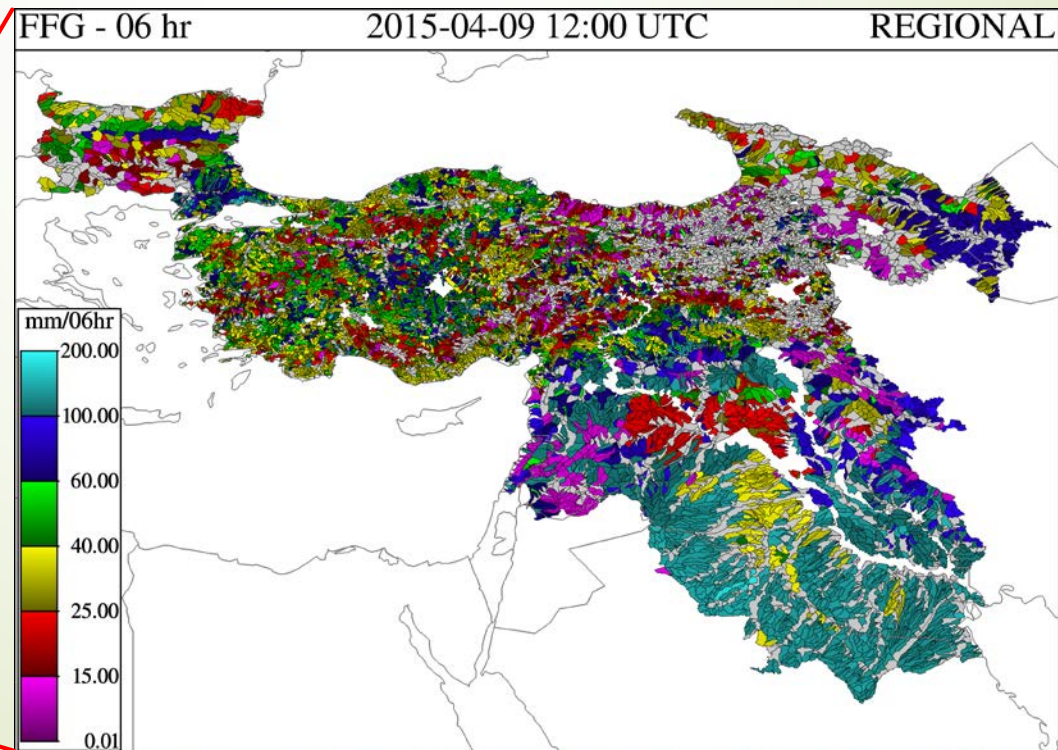

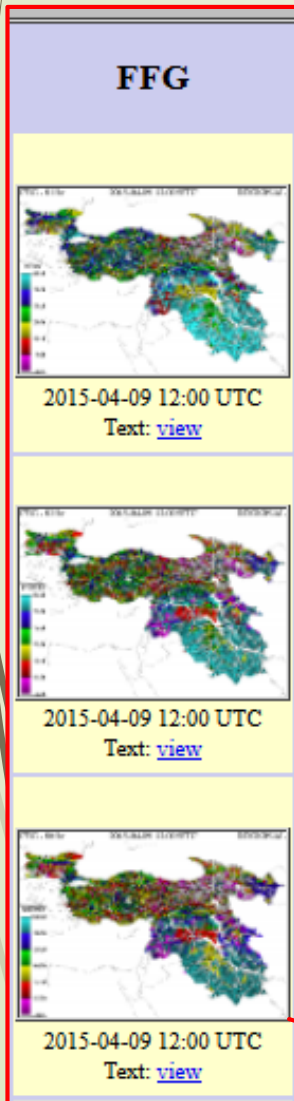

ASM reflects history of prior precipitation.

The upper soil depth is most indicative for flash flood production.

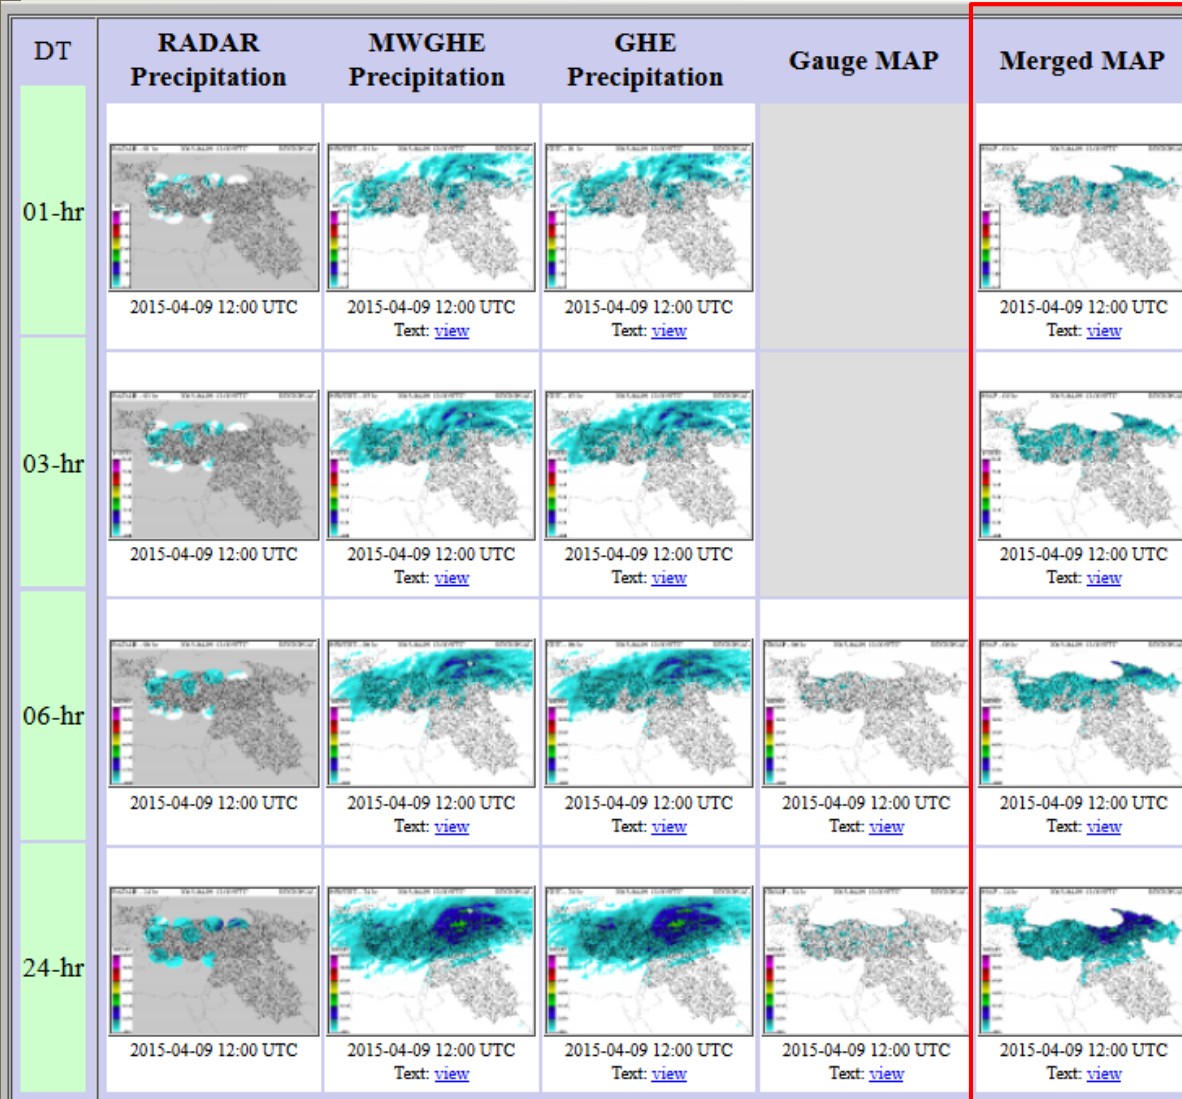

FFG

Flash Flood Guidance (FFG) is an estimate of the amount of rainfall of a given duration over a given small watershed which is enough to produce bankfull flow in the stream channel at the outlet of the watershed. The system interface provides current FFG values for durations of 1-, 3-, and 6-hours.

Observed Precipitation

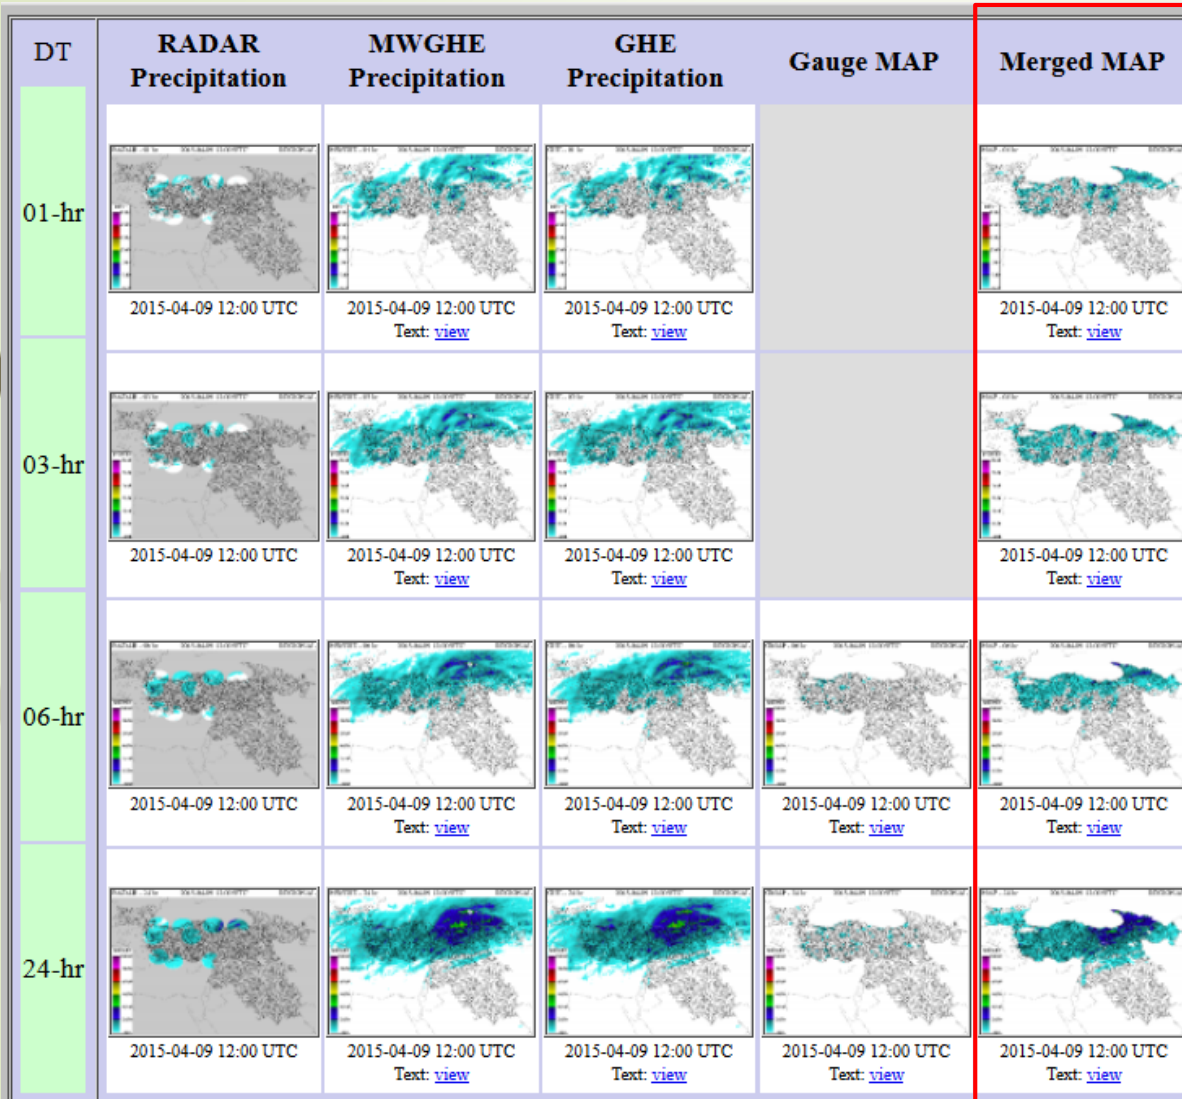

GHE: Global HydroEstimator

MWGHE: Microwave-adjusted GHE

Gauge MAP

Accumulation over the past 1-, 3-, 6- and 24-hours.

Merged MAP

Merged MAP is the *best estimate* of Mean Areal Precipitation over each small watershed for each duration (1-, 3-, 6-, 24-hr)

Flash Flood Guidance System Forecaster Interface

Prognostic Product: Forecast Precipitation and FMAP

FMAP

If a forecast precipitation product is available, the system ingests forecast precipitation estimates to calculate forecast MAP (FMAP) for each small watershed for forecast lead times of 1-, 3-, 6-, and 24-hours.

Flash Flood Threat (FFT) Products

Flash Flood Threat (FFT) products indicate the watersheds where precipitation exceeds the Flash Flood Guidance (FFG) value, based on observed, persisted, or forecast precipitation.

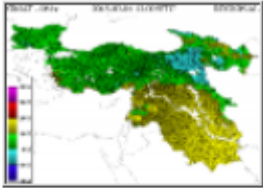

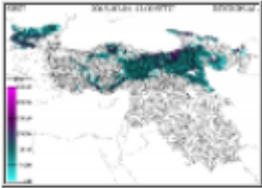

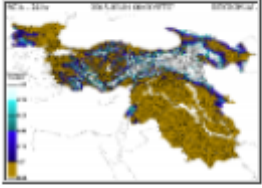

FFTs indicate watersheds where the potential for flash flooding is increased.

*FFFT products are ***not*** intended to be used for automatic warning generation. Rather these serve as indicators of regions of potential concern. The role of operational forecasters in evaluating the current situation (observed and forecast precipitation) in these regions is **critical**.*

Real-time gauge report are critically important for:

- gauge MAP product
- real-time temperature (MAT)
- dynamic precipitation bias adjustment

Preliminary Forecaster Interface Design for SAsiaFFG System

SAsia-FFG - South Asia Flash Flood Guidance System
