# INTRODUCTION

Haïti de par sa position géographique est situé dans une zone de trajectoire cyclonique, elle est classée, parmi les pays les plus exposés à de multiples risques naturels selon une étude de la Banque mondiale relative à la cartographie et aux catastrophes naturelles. En effet, depuis plus de deux décennies on assiste à une disparition presque totale de nos réseaux de contrôle de mesures hydrographiques, à une détérioration des infrastructures de surveillance hydrométéorologique. Certains ont été vandalisés suite à l'instabilité politique du pays, d'autres ont disparus par suite de catastrophes naturelles. Face à ces problèmes cruciaux qui ont affecté considérablement notre pays, il fallait trouver un issu en vue de sortir le pays de cet impasse difficile pour le placer sur la voie d'une stratégie efficace pour l'adaptation au changement climatique. Ainsi, a vu le jour la naissance de l'Unité Hydrométéorologique regroupant les services de la météo et des ressources en eau. Et ceci, en vue de renforcer les systèmes de surveillance des paramètres hydrométéorologiques et climatiques, des mesures d'observation et de contrôle à l'échelle nationale.

# Activités en cours

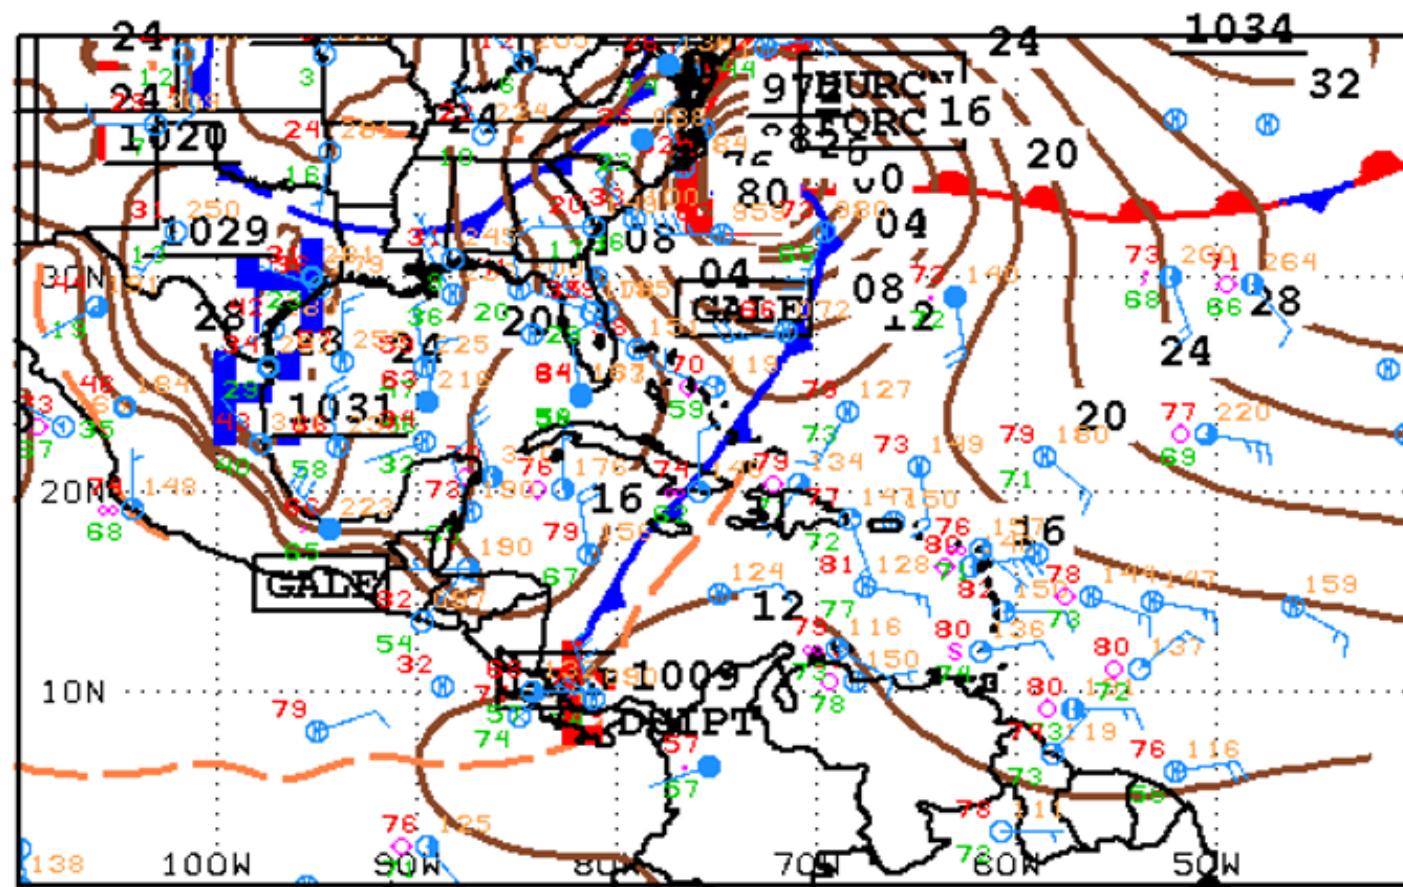

- Le projet de l'OMM soutenu par l'environnement Canada
- Le projet Hydromet de la Banque Mondiale
- Le projet de cooperation Sud Sud Fbf (financial basing and forecasting) avec Cuba implementé par World Food Program

# Case Study, 2018,January,4<sup>th</sup>

A cold Front was moving over the western Cuba and would concern Haïti 48 hours later with strong activities of Showers And Thunderstorms and then caused so much damages over the Southern and the Northwestern part of the Country.

In Fact, I propose you a look of that situation through the followings slides.

The synoptic map describes the cold front approaching the Windward passage at 10:30 utc and moving slowly through Haiti

The synoptic map describes the cold front in the Windward passage at 05 utc  
and moving slowly through Haiti

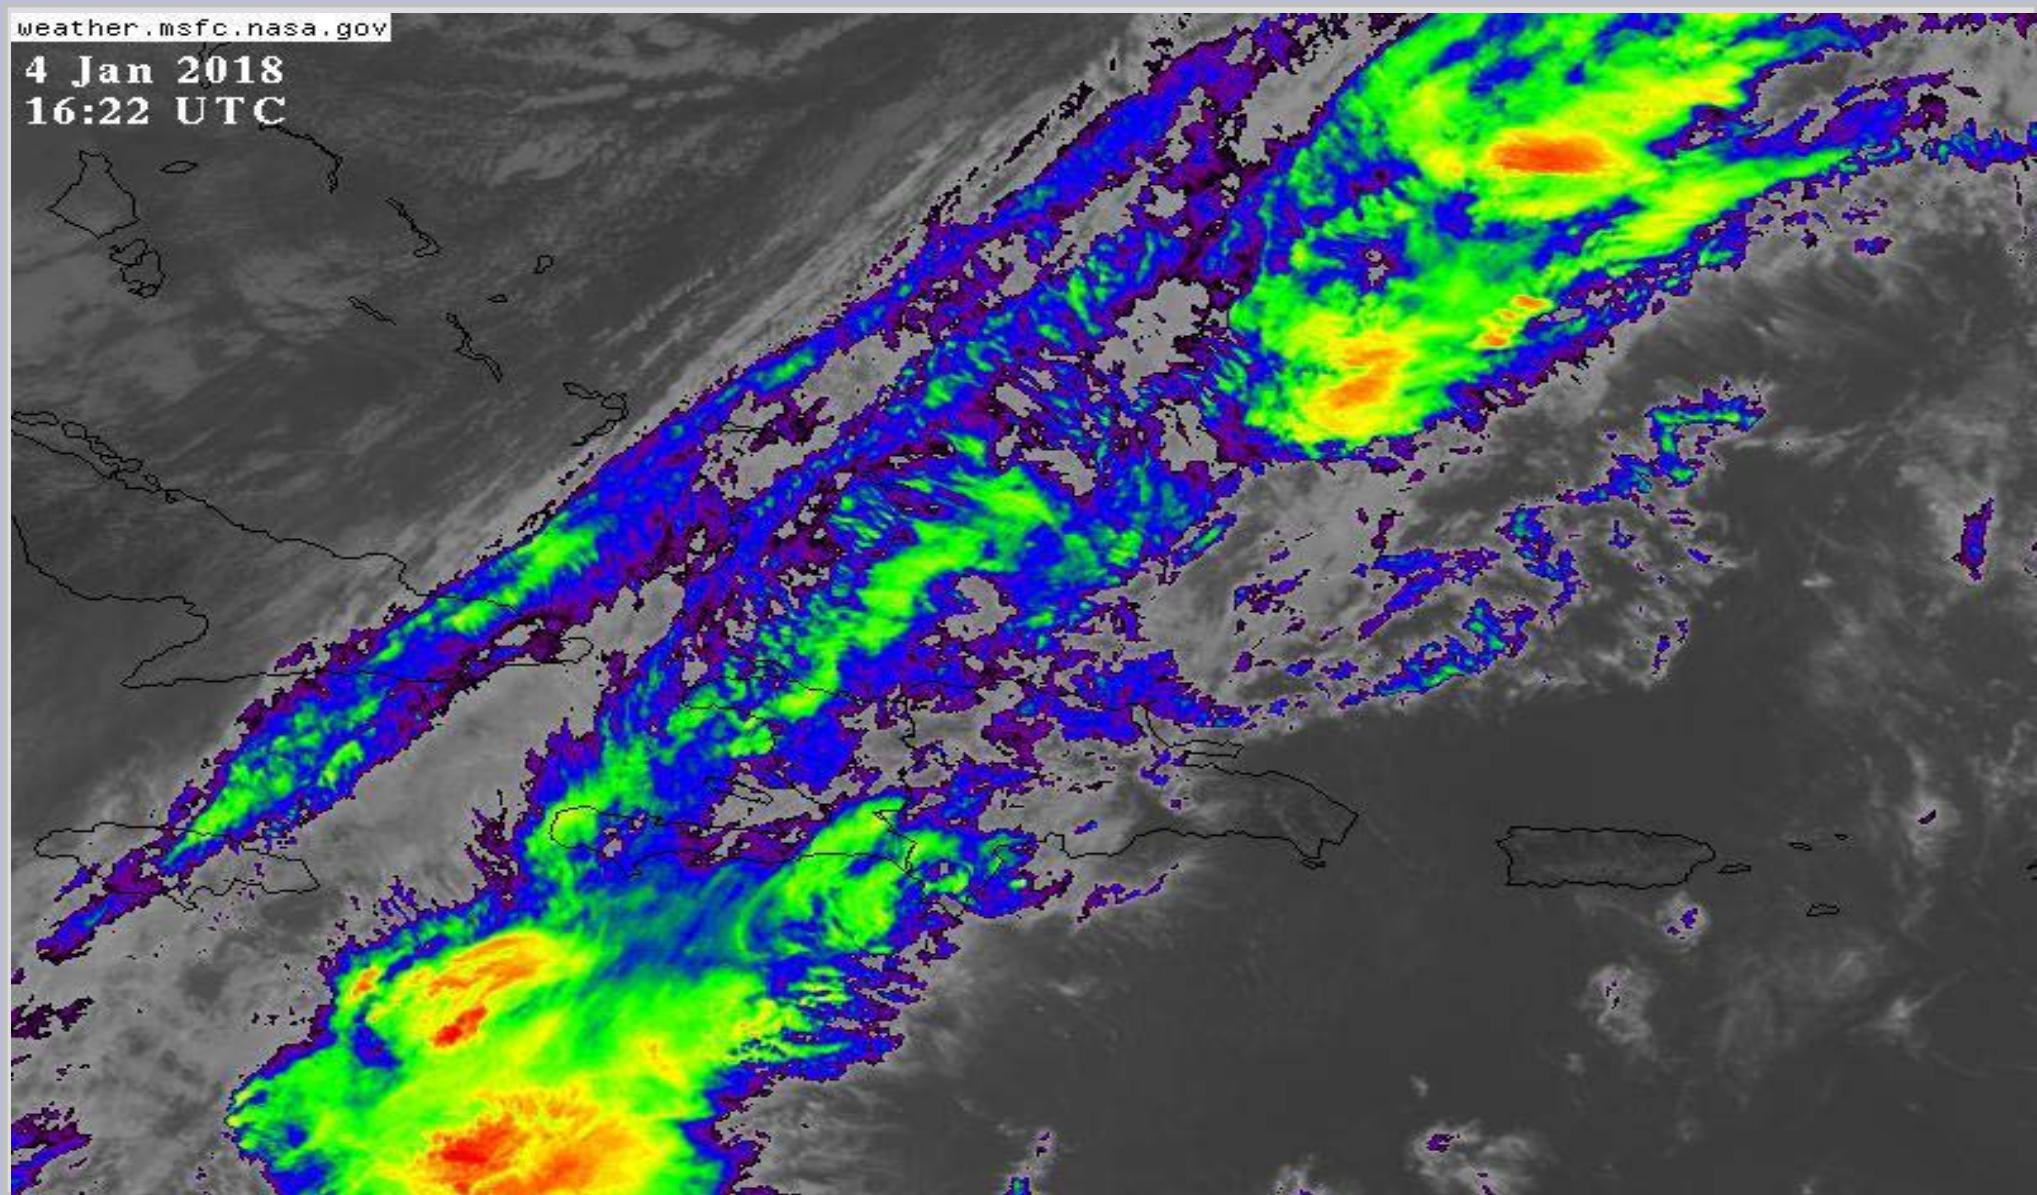

## Humidity 500 MB

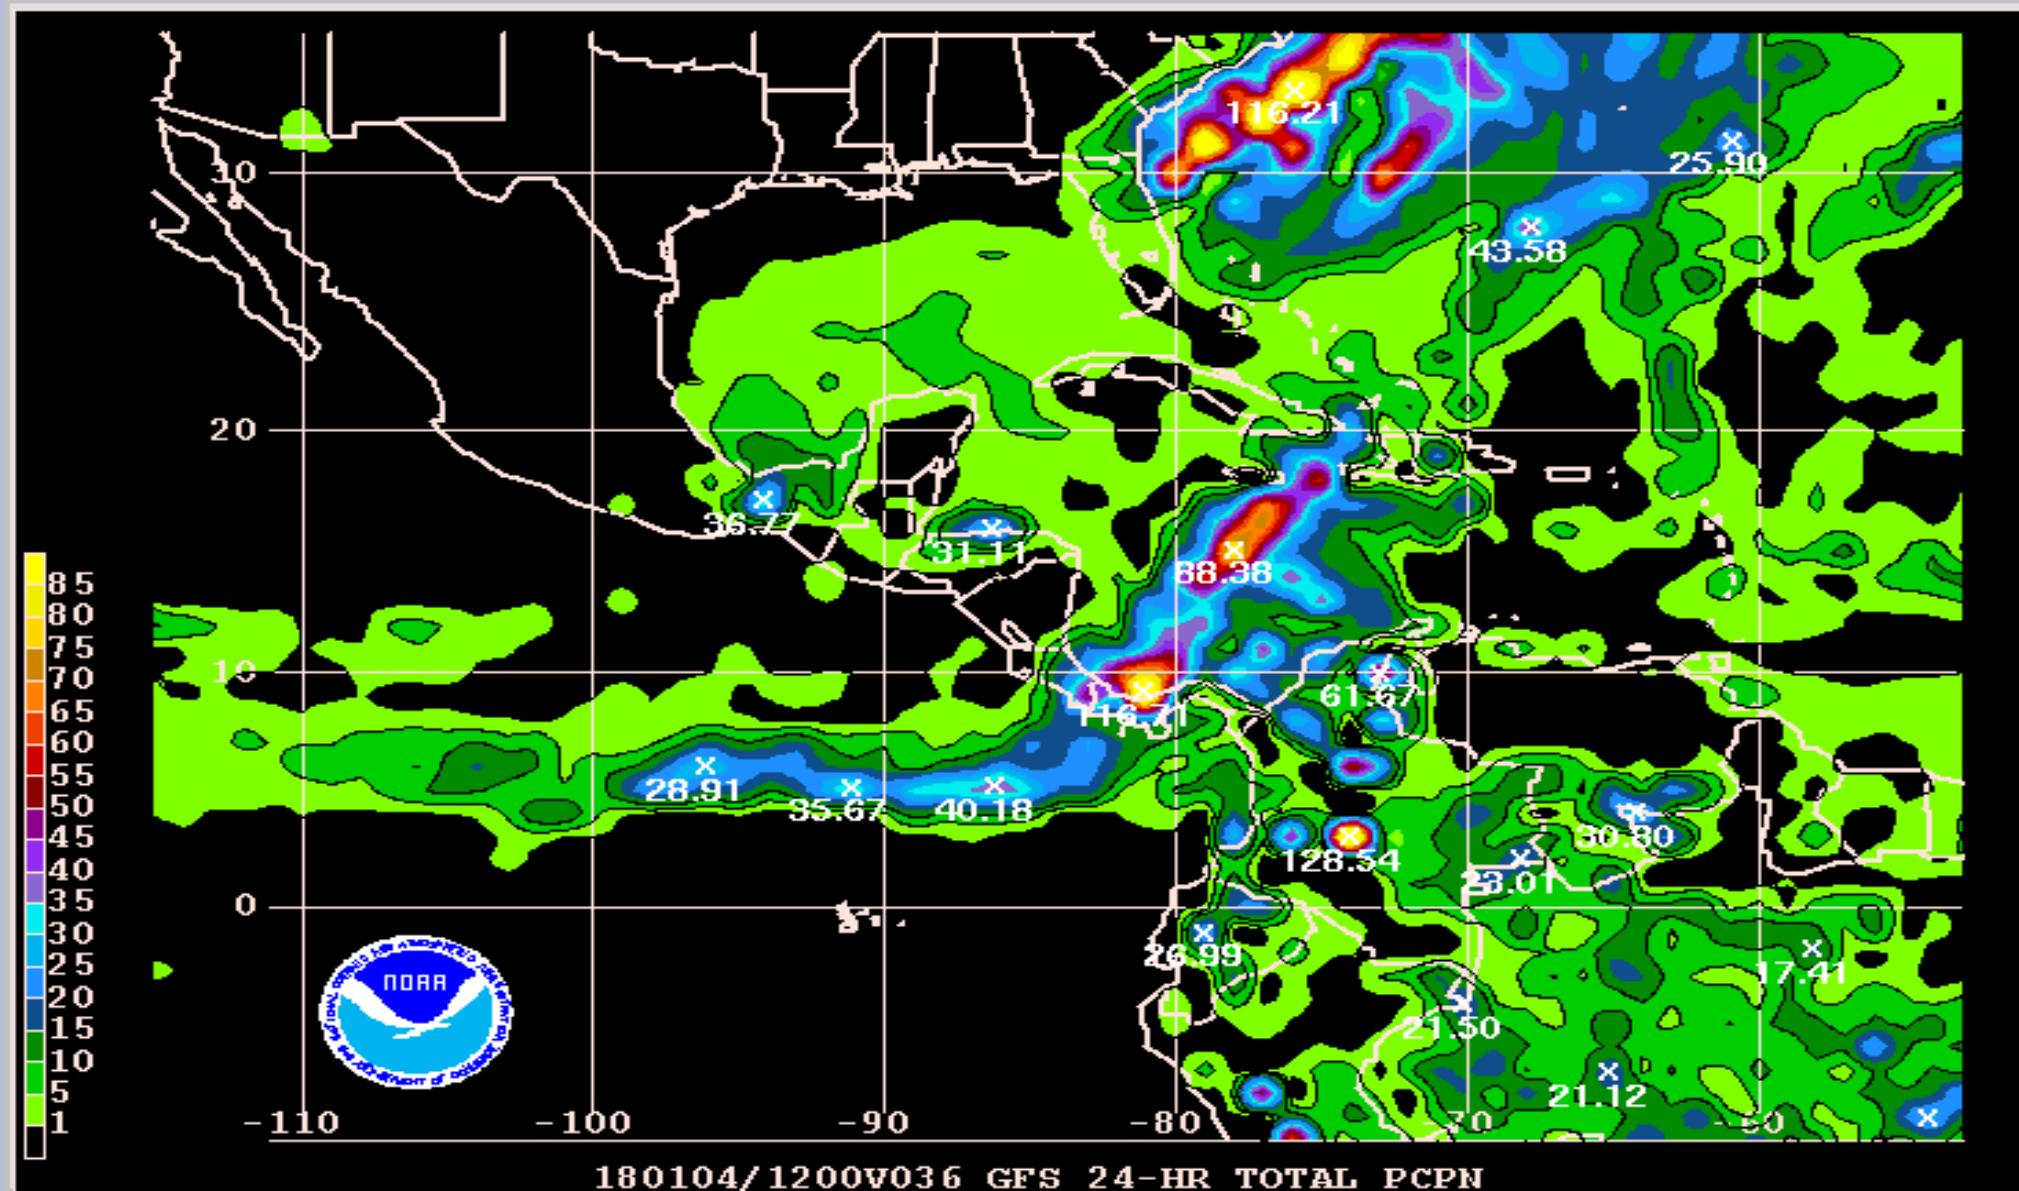

## Humidity 850 hpa

Satellite product from NOAA relative to this event

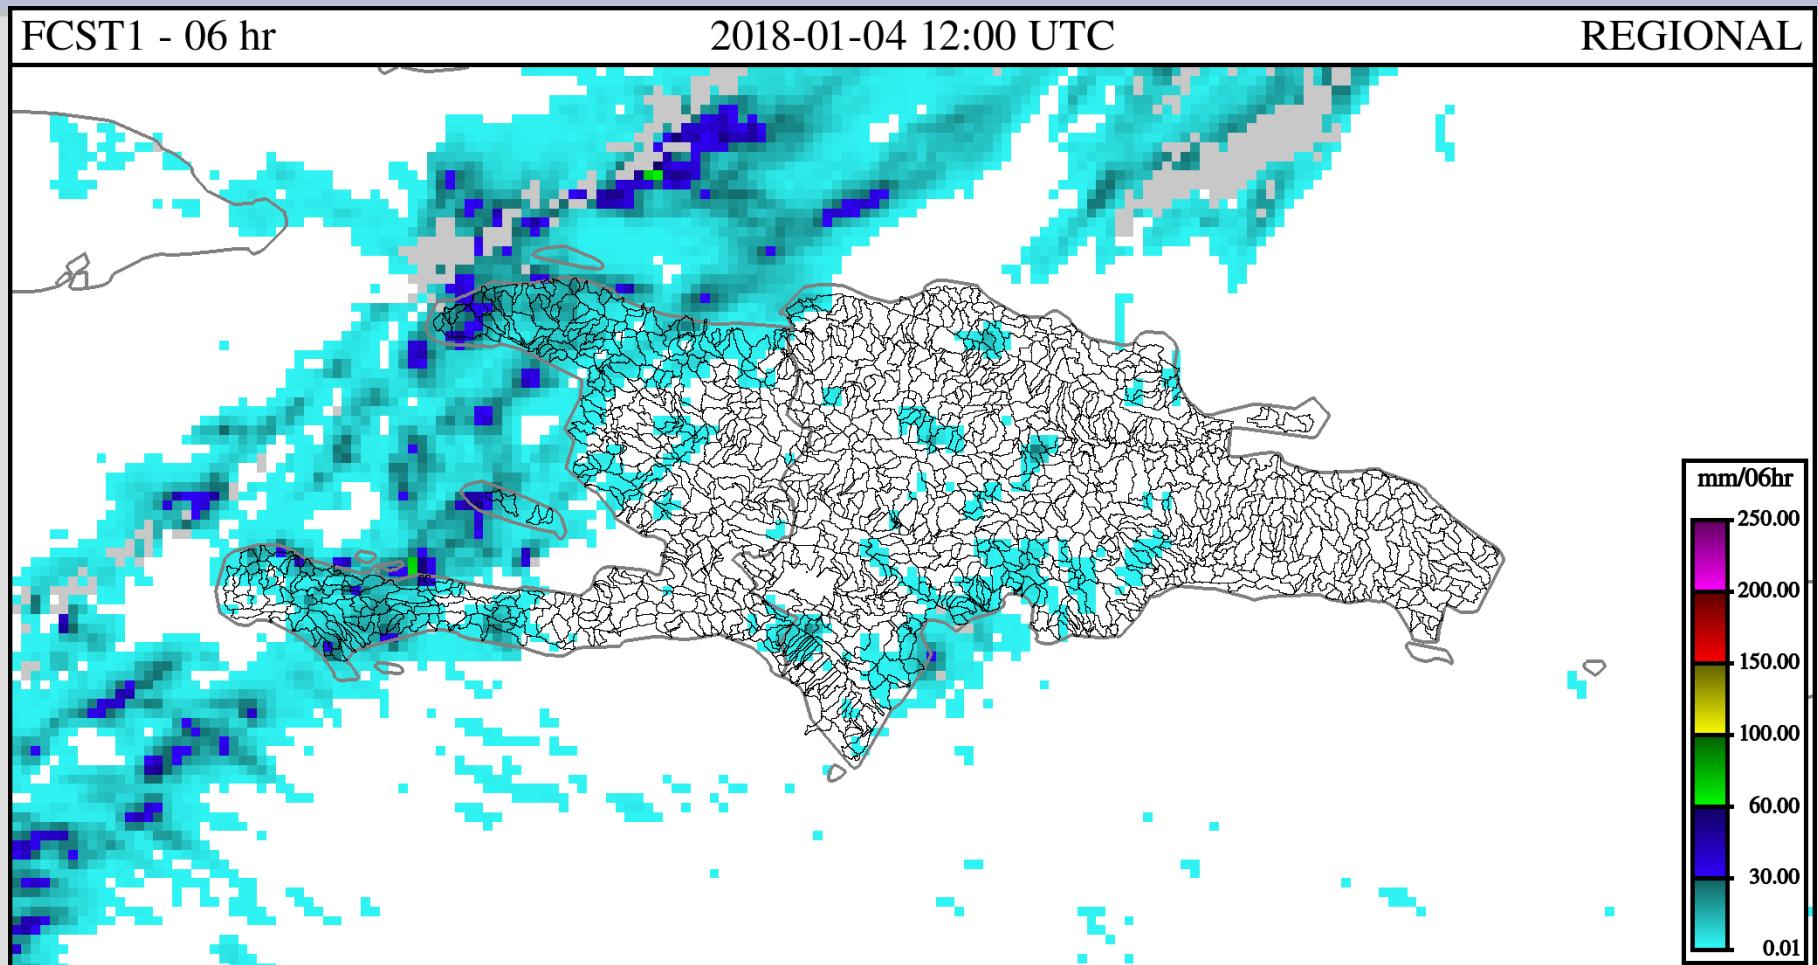

Early in the morning very strong CB have moved over the country and produced a lot of rainfall

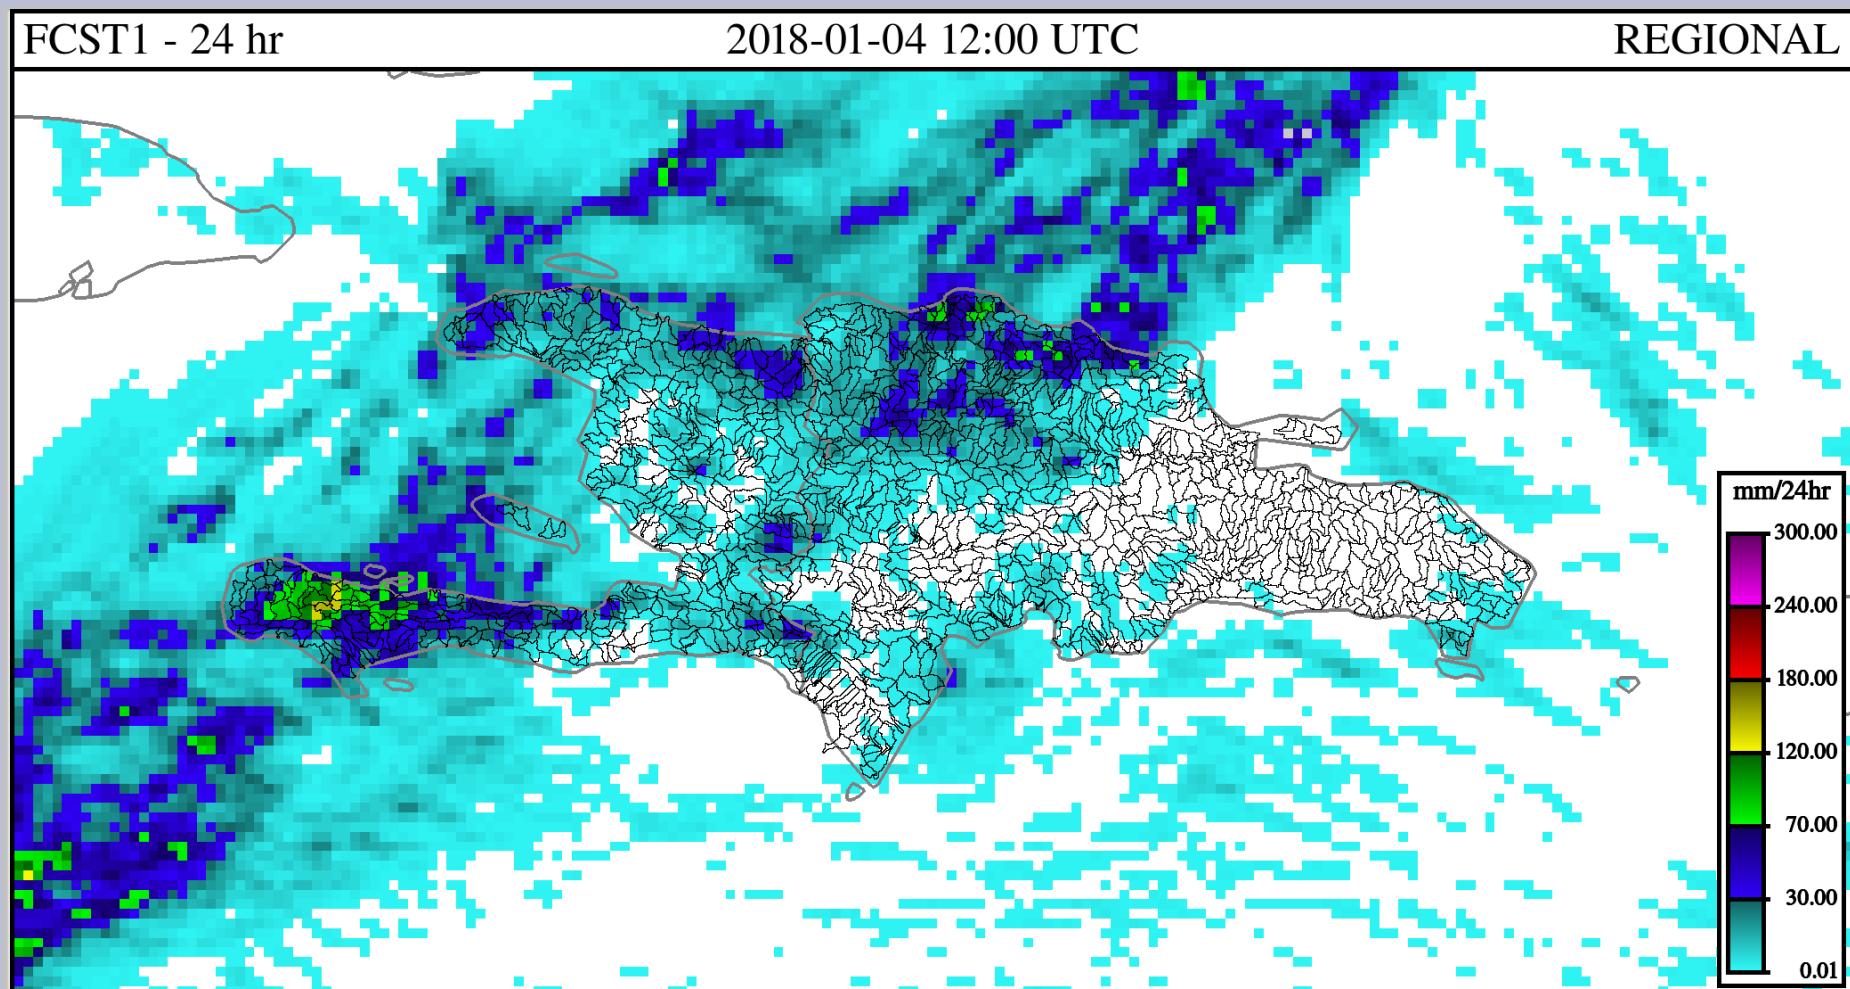

How FFGS dealed with this event?

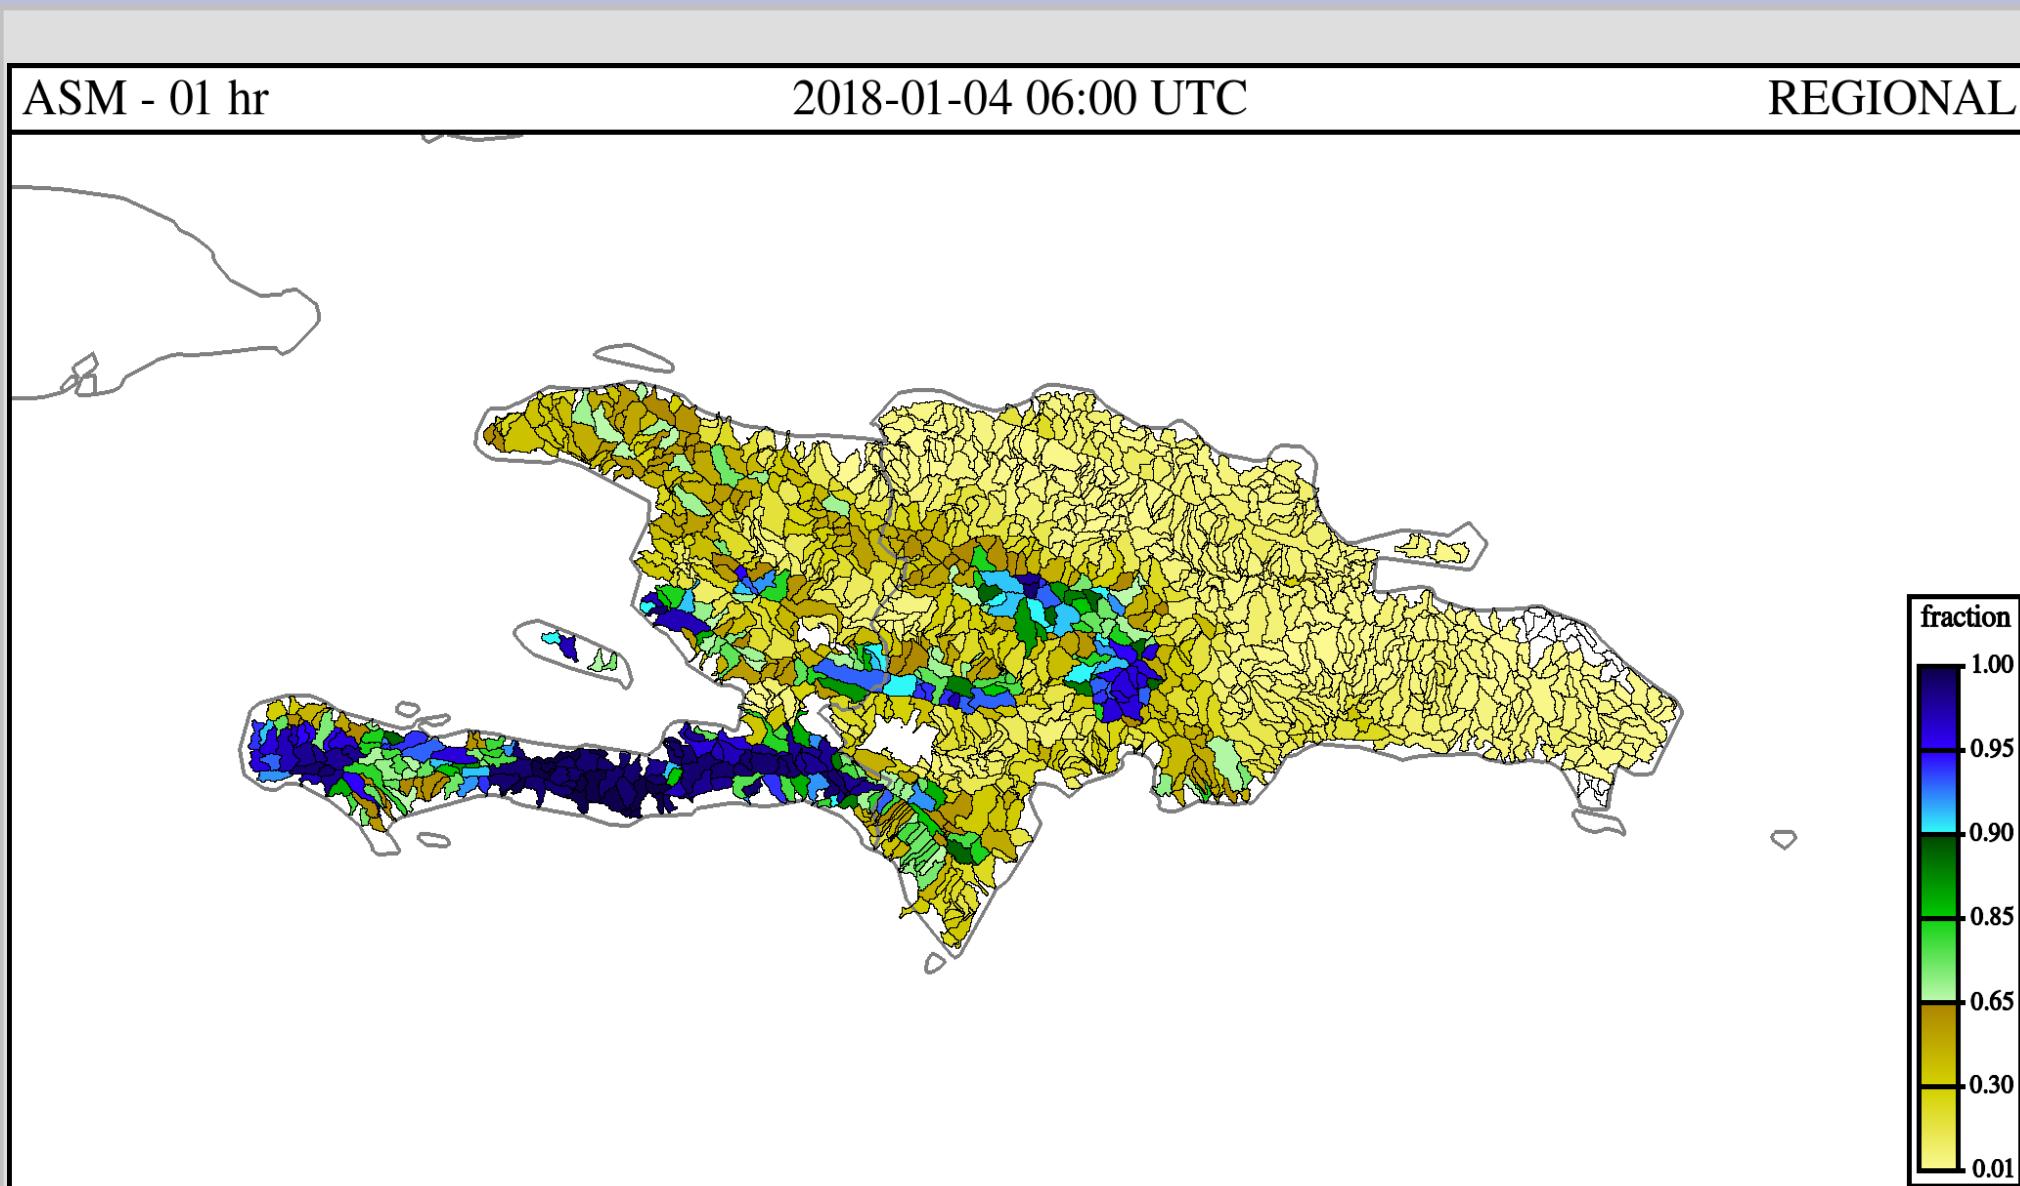

# Forecasted Precipitation in six hours

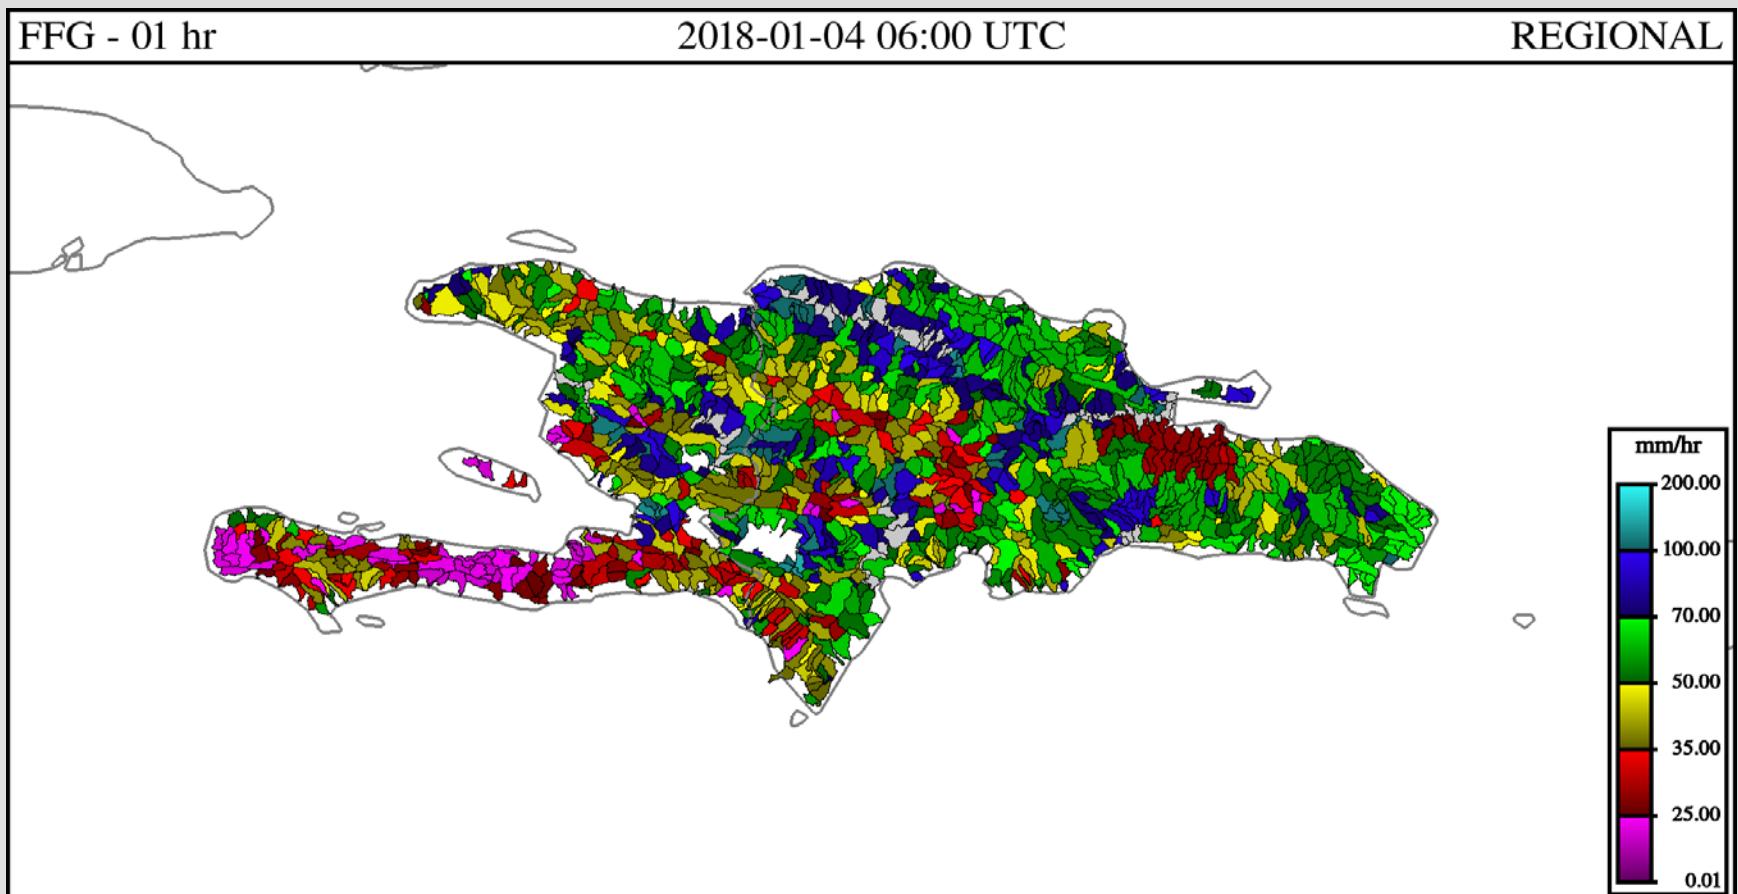

# Forecasted Precipitation in 24 hours

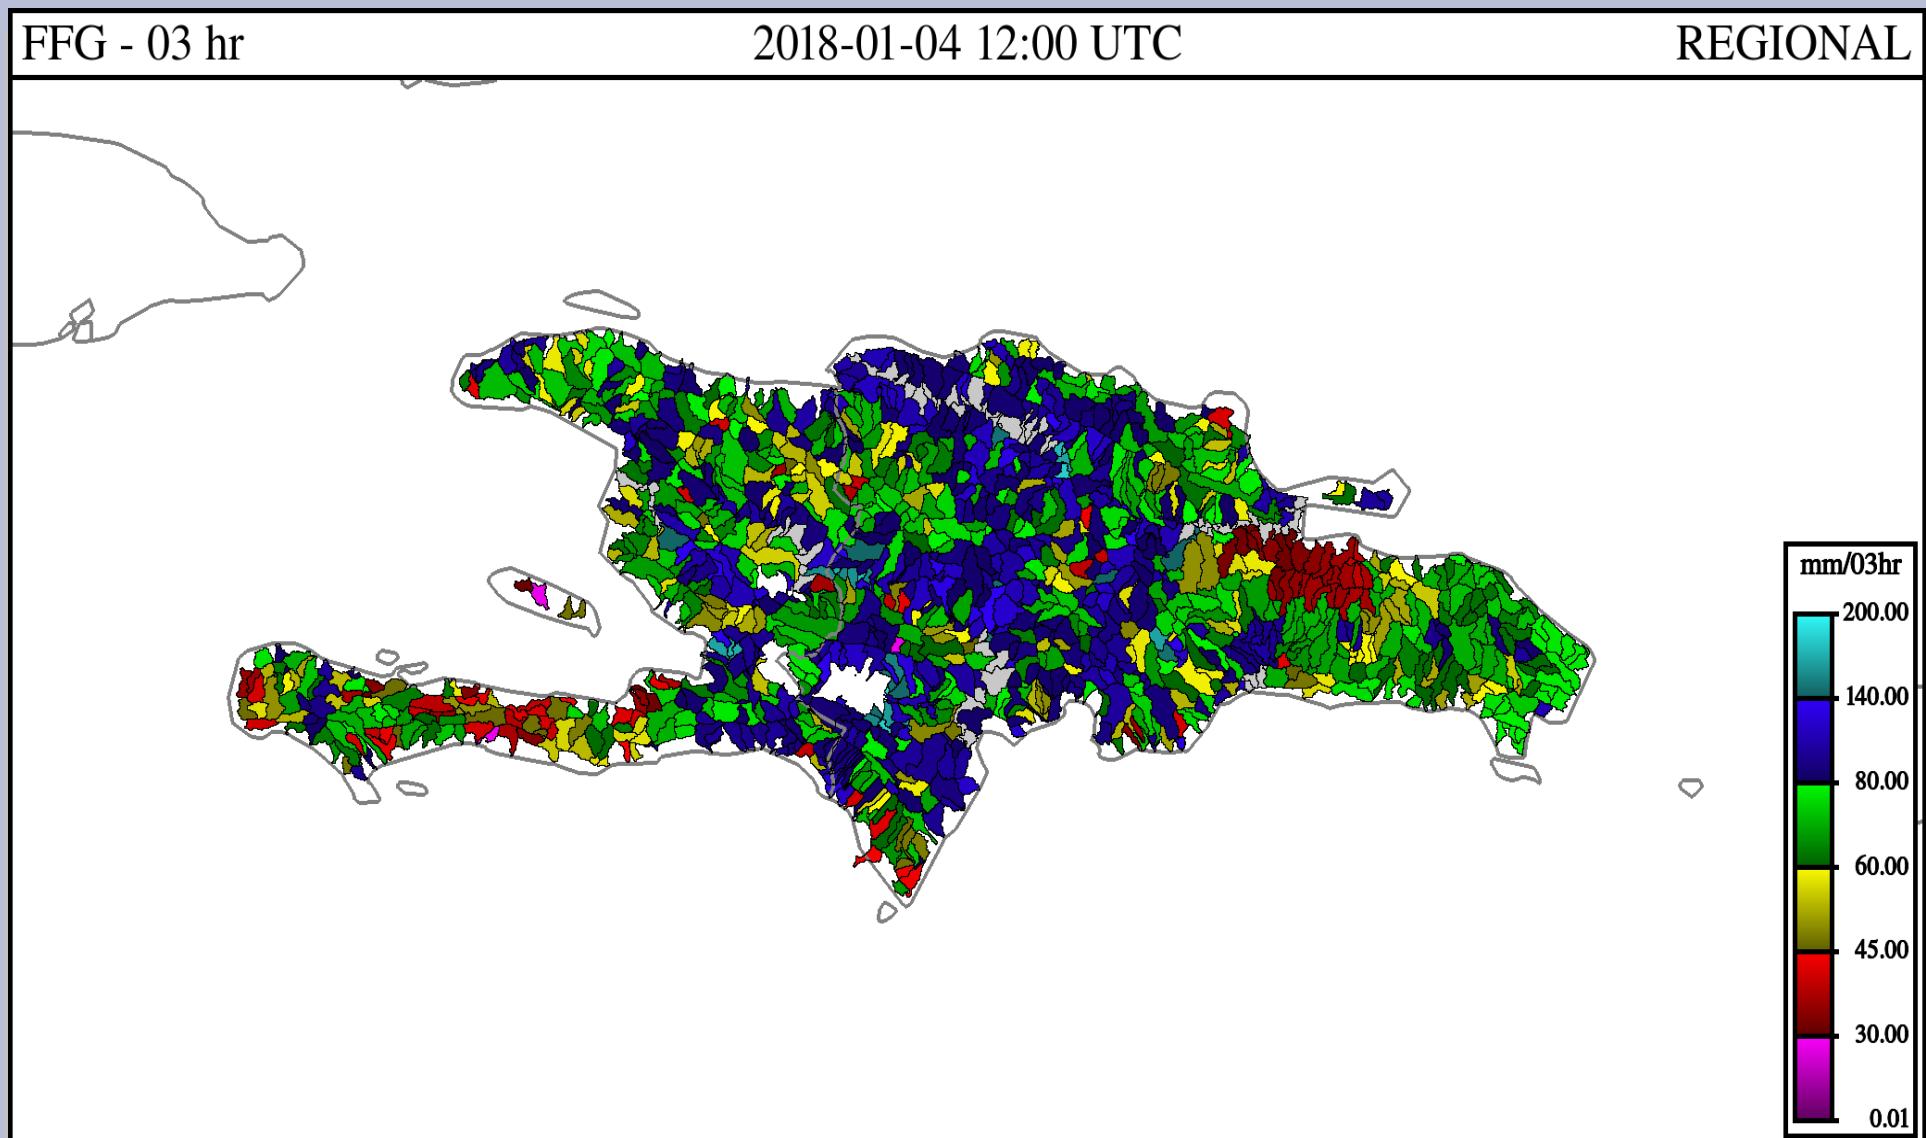

Soil condition Moisture (ASM) let's understand how the level of saturation is high over the whole south peninsula and other places in the Central, West part almost 100/100.

FFG values were very low over the same regions

Three hours later some FFG low values  
were still persistant in the southern part  
and somewhere else.

## General Forecasting Bulletin issued by the National weather Service.

An active cold front accross the Windward Channel today and moving to Hispaniola bringing heavy activities of showers and thunderstorms over Haïti today. Therefore, some of departements are likely to affected by flash flooding and lanslid during the passage of this front.

## Flash Flooding Warning

The Hydrometeo service (HMU) in partnership with the Civil Protection (DPC) and the Permanent Secretariat of Risk and Disaster Management (SPGRD) recommends to all people living near areas at risk to be vigilant and apply all safety conditions because of these frequent showers over the country. This warning is issued for all the country but The south peninsula is more concerned.

**THANK YOU !!!!!**
