

OPERATIONAL NEWSLETTER

VOLUME 1997

No. 7/8 - JULY/AUGUST 1997

WORLD WEATHER WATCH

WORLD METEOROLOGICAL ORGANIZATION
GENEVA
SWITZERLAND

The WMO Secretariat would like to express its appreciation to all those who have contributed material to the "Operational Newsletter". ■

EDITORIAL

The Operational Newsletter on the World Weather Watch (WWW) and Marine Meteorological Services (MMS) has been issued since 1982 at the request of the Commission for Basic Systems. It is distributed by the WMO Secretariat and is aimed at providing WWW Centres with a summary of the latest operational information on:

- The Global Observing System
- The Global Telecommunication System
- The Global Data-Processing System
- Data Management and Codes
- Marine Meteorological Services

A feedback form is included in the Newsletter to assist WMO Members in reporting changes in the present status of implementation of observing programmes of SYNOP, TEMP and PILOT reporting stations.

Your co-operation in ensuring that the above information reaches the appropriate operational units of your service is greatly appreciated.

In addition to the printed version which is distributed by mail, the Operational Newsletter is also available at the following locations:

For access via FTP:

<ftp://www.wmo.ch/wmo-ddbs/>

For access via http:

<http://www.wmo.ch/web/ddbs/opnews.html>

PLEASE check our World Weather Watch home page for the most recent edition.

The file is created in Adobe Acrobat PDF format so that users can easily download, view or print the document from different computer platforms, keeping the page layout and typography of the original document intact.

To view the Newsletter you will require "Adobe Acrobat Reader", which can be downloaded from:

[http://www.adobe.com/prodindex/Acrobat/
readstep.html](http://www.adobe.com/prodindex/Acrobat/readstep.html)

We apologize to those readers who may have experienced difficulties with our electronic version of the 11/12 1996 Newsletter produced in .html. You may be pleased to know that this was done on a trial basis. This year we hope to keep to our standard format of .pdf.

Comments are more than welcome. Should you have any difficulties downloading, viewing or printing the Newsletter ... Our e-mail address is as follows:

PWOI@WWW.WMO.CH

We look forward to hearing from you.

Rising costs demand that we scale down the distribution of the Newsletter by letter mail, so we strongly encourage our readers to help us become more cost-effective by using our new on-line service.

**THE WORLD METEOROLOGICAL ORGANIZATION
IS PLEASED TO ANNOUNCE
THE WMO TECHNICAL CONFERENCE
ON
METEOROLOGICAL AND ENVIRONMENTAL INSTRUMENTS
AND
METHODS OF OBSERVATION (TECO-98)
WITH A
TECHNICAL EXHIBITION (METEOREX-98)**

13 to 15 May 1998, Casablanca, Morocco

The Conference will immediately follow the forthcoming twelfth session of the WMO Commission on Instruments and Methods of Observation (CIMO-XII, 4 to 12 May 1998, Casablanca, Morocco) and will be held at the same venue.

Under the conference theme:

"Measurements: a widening horizon of technology and applications"

**EXPERTS FROM NATIONAL METEOROLOGICAL AND HYDROLOGICAL SERVICES,
RESEARCH INSTITUTES AND THE PRIVATE SECTOR WILL ADDRESS THE FOLLOWING MAIN SUBJECTS:**

1 New developments, operational experience and results of intercomparisons in meteorological and environmental measuring technology related to:

- Surface measurements including sensors, automatic stations and systems for specific applications and requirements;
- Upper-air in situ measurements, including alternatives for OMEGA-dependent wind finding systems;
- Surface-based remote sensing techniques;

2 Quality management, sensors calibration technology and methodology, validation of surface-based remote sensing systems;

3 Management and cost aspects related to instruments and observing methods; technology transfer; capacity building including training needs and opportunities

**SIMULTANEOUS INTERPRETATION OF ENGLISH, FRENCH, RUSSIAN
AND SPANISH WILL BE AVAILABLE**

Chairperson of the Organizing Committee:

Dr A. van Gysegem,
Institut royal météorologique de Belgique,
3 Av. Circulaire,
B-1180 Bruxelles,
Belgique

I. GLOBAL OBSERVING SYSTEM

INFORMATION ON THE OPERATIONAL STATUS OF THE SPACE SUB-SYSTEM

WMO DATABASE ON OBSERVATION SATELLITE MISSION

The WMO Satellite Activities home page has recently been updated to contain satellite mission and instrument information. Detailed information for almost 150 satellite missions and 300 instruments can be viewed. Each instrument is linked to a user requirement indicating which parameter(s) will be measured. In particular, it is possible to obtain information concerning the instrument name, type, sponsoring Agency, wavebands, mission(s) the instrument will fly on, launch dates, and which parameters it will measure cross referenced to user requirements. The data has been compiled through a cooperative effort between the international user community with WMO acting as a focal point and the various space agencies as represented in the Committee on Earth Observation Satellites (CEOS). To view the information, use URL <<http://www.wmo.ch>> then select "WMO Satellite Activities" then select "Instrument Information".

INFORMATION ON THE OPERATIONAL STATUS OF ELEMENTS OF THE SURFACE-BASED SUB-SYSTEM

AUTOMATIC MARINE STATIONS

KEY: Observed or Technical Parameters

Column	Parameters	Column	Parameters
1	Wind direction, speed and peak wind	12	Battery Voltage (BV)
2	Air temperature		
3	Air pressure	-	Parameter not observed
4	Pressure tendency	X	Buoy observes this parameter
5	Sea-surface temperature	.	Data under evaluation, not reported
6	Wave period and height		
7	Wave spectra	B	Buoy beached, sensor reporting
8	Drogued	N	No sensor installed
9	Subsurface temperatures	Q	Data questionable, but reported
10	Relative humidity	R	Buoy Retrieved
11	Visibility	S	Sensor/system failure

REMARKS:

44131 stopped transmitting.

44139 buoy adrift.

44140 buoy ashore.

I.**UNITED STATES OF AMERICA**

List of U.S.A. Ocean Data Acquisition Systems (ODAS) included in the Data Platform Status Report of the Data Buoy Centre of the National Oceanic and Atmospheric Administration (NOAA) on 29 August 1997. Data from moored buoys and platforms are collected by geostationary meteorological satellites and reports are distributed on the GTS in SHIP code. Data from drifting buoys are collected by the ARGOS system and distributed on the GTS in DRIFTER CODE.

MOBILE SEA STATIONS

AUTOMATED SHIPBOARD AEROLOGICAL PROGRAMME (ASAP)

DAYLIGHT SAVING TIME

NOTIFICATION FROM NEW ZEALAND

NOTIFICATION FROM THE ASAP COORDINATING COMMITTEE

The United States of America has a new ASAP ship in service. The ship is currently taking four soundings a day during this intense research mode. However the standard will be two soundings a day. The details are provided below:

New ASAP ship call-sign: WTEC

Sonde release elevation: 10 metres

Ship Name: NOAA RESEARCH VESSEL 'RONALD H. BROWN'

Coded TEMP message transmission method: INMARSAT-C

Equipment Used: Ex-Canadian ASAP Container and DigiCora MW11. Also has a PC running Vaisala Metgraph. Totex 200 g balloons. Vaisala Omega or GPS Sondes (mixed at present).

Area of Operations: Worldwide. This first cruise (began July 1997) from Charleston SC to transit Panama to cruise area 10°N 125° W. At the end of August 1997 it will transit cruise area to San Diego CA, thence Newport OR, thence San Francisco CA.

GTS headers for coded TEMP messages: They should show up on the GTS with the same Headers as the messages from NOAA's Ka'Imimoana, Call-sign WTEU, e.g.

USV*01 KWBC ddhh00 (UUAA)

UKV*01 KWBC ddhh00 (UUBB)

ULV*01 KWBC ddhh00 (UUCC)

UEV*01 KWBC ddhh00 (UUDD)

(Coding is standard ASAP international - siglevels of upper winds are coded in UUBB and UUDD after a 21212 indicator group.)

A period of daylight saving will be introduced from 1400 UTC on 5 October 1997 to 1400 UTC on 15 March 1998.

During this period all SYNOP reports and upper-air soundings will be carried out one earlier.

FEED-BACK

FROM MEMBERS TO THE SECRETARIAT ON ANY CHANGES IN THE OBSERVING NETWORK

In view of the difficulties experienced in identifying non-implemented observing stations or implemented stations which are closed or suspended for a certain period, or stations making observations that do not reach their NMCs, a special table accompanied by explanatory notes is included in this Newsletter. The table will serve as feed-back from Members to the Secretariat on any changes of the present state of implementation of observing programmes of SYNOP, TEMP and PILOT reporting stations.

Members are urged to fill in the special table as and when appropriate, and to return it to the Secretariat before the 20th of each month to enable changes to be included in the next "OPERATIONAL NEWSLETTER".

EXPLANATORY NOTES

Separate tables should be prepared for global exchange and regional exchange respectively. These tables should contain information concerning any changes of the present state of implementation of observing programmes of SYNOP, TEMP and PILOT reporting stations for Volume A, the Catalogue of Meteorological Bulletins, and for stations included in the Regional Basic Synoptic Networks (RBSN).

For entries in these tables, the following should be taken into account:

COLUMN A: The station index number (IIii) and station name;

COLUMN B: Latitude and Longitude in degrees and minutes with the appropriate letters (N, S, E and W);

COLUMN C: The TTAIii CCCC of the abbreviated headings of the meteorological bulletins which contain reports from the station should be inserted;

COLUMN D: “X” for implementation and “-” for non-implementation should be inserted as appropriate. In order to easily identify changes in the programme, these should be marked in red;

COLUMN E: HP = Elevation of the station in metres (the datum level to which barometric pressure reports at the station refer);

H = Elevation of the ground, in metres, (average level of terrain in immediate vicinity of station), for stations not located on aerodromes;

HA = Official altitude of the aerodrome given for stations located on aerodromes is indicated by the letter “A” in the column “Other observations and Remarks” of Volume A;

COLUMN F: For those stations not indicating pressure reduced to mean sea level (group 4PPPP) in their synoptic reports, the entry in this column shows which information is reported in lieu of group 4PPPP (see table 1):

STATION	Pressure at station level reported using group 3P _o P _o P _o P _o
1000 hPa	
850 hPa	
700 hPa	
500 hPa	Geopotential of the given standard isobaric surface reported using group 4a ₃ hhh

Table 1

COLUMN G: Reasons for temporary suspension of observing programmes and an expected date of resumption of the programmes should be given as far as possible. Non-standard collection and/or distribution times should also be included, and also possible alternate observing stations, as appropriate.

These tables should be sent to the Secretariat

BEFORE the 20th of the month

for inclusion in the

“OPERATIONAL NEWSLETTER”, as appropriate.

RADIO-FREQUENCIES FOR METEOROLOGICAL ACTIVITIES

The 1997 World Radiocommunication Conference (WRC-97, Geneva, 27.X-21.XI 1997) will consider several items of concern for meteorology, related to frequency allocations to meteorological aids (radiosondes), meteorological satellites, wind profiler radars and spaceborne passive remote sensing. The following Annex provides background information and guidance on these issues of importance to meteorology, both for operational requirements and research purposes.

GUIDANCE AND BACKGROUND INFORMATION ON 1997 WORLD RADIOCOMMUNICATION CONFERENCE ISSUES

1. Possible additional frequency allocations to the Mobile-Satellite Service in the 401-406 MHz, 1675-1710 MHz and 137-138 MHz bands.

1.1 The World Administrative Radio Conference in 1992 (WARC-92) decided the allocation to other radiocommunication services as primary service in bands allocated to the Meteorological Aids and Meteorological-Satellite Services, as follows:

137-138 MHz:

Mobile-Satellite Service, primary status in 137-137.025 and 137.175-137.825 MHz, secondary in the rest of the band

400.15-401 MHz:

Mobile-Satellite (space to earth) (non-geostationary satellite systems)

1670-1675 MHz:

Mobile - Aeronautical Public Correspondence (from aeronautical stations to aircrafts)

1675-1710 MHz:

Mobile-Satellite (earth to space) in ITU Region 2 (i.e. North, Central and South America). Footnote S5.377 requires MSS not to cause harmful interference to, nor constrain the development of Met-Sat and Met-Aids.

1.2 Possible further allocations for the Mobile Satellite Service (MSS) in the bands 401 - 404 MHz and 1675-1710 MHz were considered by the World Radio-

communication Conference in 1995 (WRC-95). After considerable discussions, WRC-95 did not finally adopt changes to the present allocations, but adopted Resolutions calling for urgent studies of sharing conditions between MSS, Met-Sat and Met-Aids in both bands to be completed as a matter of urgency and in time for WRC-97.

1.3 The 1997 World Radiocommunication Conference (WRC-97, Geneva, 27.X-21.XI 1997) will, "taking into account the needs of other services to which the relevant frequency bands are already allocated, consider issues concerning existing and possible additional frequency allocations and regulatory aspects as related to the mobile-satellite". This includes consideration of the possible use of 401-406 MHz and of 1675-1710 MHz bands.

401-406 MHz band

1.4 As regards sharing between meteorological aids and non-Geostationary Satellite Orbiting MSS in the band 401 to 406 MHz, sharing studies by the ITU Radiocommunication Sector (ITU-R) have shown that co-channel sharing with currently proposed non-Geostationary Satellite Orbiting MSS systems (also called Low-Earth Orbiting satellites-LEOs) is not generally feasible due to excessive interference to both the Met-Aids system and to the MSS system. Therefore, any sharing of the band 401 to 406 MHz would require band segmentation.

1.5 Further band segmentation would require more spectrum efficient meteorological aids systems, which

would significantly increase the operational costs and would have a detrimental impact on meteorological radiosondes operations. As a follow-up to the ITU-R request, WMO considered improvements of radiocommunication characteristic of radiosonde systems, taking into account that possible improvements should not drive the operational costs of radiosonde networks above the available financial resources of National Meteorological Services of WMO Members and should not have a detrimental impact on meteorological operations. On this basis and in consultation with manufacturers and representative National Meteorological Services of both developed and developing countries, WMO has developed an assessment of radio-frequency spectrum requirements for radiosonde systems in the Meteorological Aids Service. The goals for frequency spectrum requirements of radiosonde systems achievable by 2010 have been identified as 5 MHz in the 400.15 - 406 MHz band, including use of spectrum which must be coordinated with the Data Collection system (Earth-to-space) of the Meteorological Satellite Service (401-403 MHz).

1.6 In conclusion, any further allocation to the Mobile Satellite Service in the band 400.15 - 406 MHz would have a serious detrimental impact on meteorological operations, driving the operational costs of Met-Aids networks above the available financial resources. Alternative bands should be considered for the MSS below 1 GHz.

1 675 - 1 710 MHz band

Possible additional allocations to the Mobile Satellite Service (MSS) in the band 1675-1710 MHz should take into account both the requirements of the Meteorological Satellite Service (Met-Sat) and of the Meteorological Aids Service (Met-Aids).

Meteorological Satellite Service (Met-Sat)

1.7 The band 1 675 - 1 710 MHz is used by Meteorological Satellite systems as follows:

1 675 - 1 690 MHz:

primarily (but not exclusively) a limited number of main earth stations at fixed locations for reception of raw image data, data collection data and spacecraft telemetry from geostationary meteorological satellites;

1 690 - 1 698 MHz:

user stations for direct readout services from geostationary meteorological satellites. However, some geostationary meteorological satellites (GOES and GMS) currently use also frequencies below 1 690 MHz (i.e. 1683-1691 MHz) to provide some direct readout services (GVAR and S-VISSR respectively);

1 698 - 1 710 MHz:

user stations for direct readout services and prerecorded image data at main earth stations from non-geostationary meteorological satellites.

1.8 With respect to sharing of the 1 675 - 1 710 MHz with the MSS (Earth-to-space), the feasibility of sharing between the MSS and the Met-Sat is described in the revised ITU-R Recommendation SA.1158. In the 1 675 - 1 690 MHz band, sharing is considered feasible if a separation distance of up to 55 km (for LEO MSS) and up to 70 km (for GEO MSS) is kept at all times between the meteorological satellite earth stations and the MSS earth station locations. In the 1 690 - 1 698 MHz band, sharing is not feasible due to the very large number (thousands) of Met-Sat earth stations. In the 1 698 - 1 710 MHz band, sharing based on geographical separation is not feasible; a preliminary study considered possible time-sharing between MSS and polar-orbiting meteorological satellites, but, in WMO's view, the practicality of time-sharing appears highly questionable and it may be potentially detrimental to future Met-Sat operations.

1.9 Sharing between the MSS and the Met-Sat would only be feasible in the 1 675 - 1 690 MHz band, with adequate conditions (separation distance between MSS and Met-Sat stations). In areas where GOES/GVAR and GMS/S-VISSR stations are in operation (the Americas and Asia-Pacific respectively), sharing between the MSS and the Met-Sat would not be practicable in the 1 683 - 1 690 MHz band. The allocation of 1675 - 1710 MHz to the Mobile Satellite Service in ITU Region 2 (i.e. North, Central and South America) decided by WARC 92 should be cancelled at least as regards the band 1 690 - 1 710 MHz.

Meteorological Aids Service (Met-Aids)

1.10 The feasibility of sharing between the MSS and the Met-Aids is described in the new ITU-R Recommendation SA.[Doc 7/38]. Sharing studies completed to date indicate that co-channel sharing between currently proposed MSS systems and Meteorological Aids operated in the band 1 675 - 1 700 MHz is not feasible. Band segmentation would be the only possible method of providing MSS spectrum from this band, and segmentation of the band could potentially have a detrimental impact to meteorological aids operations if the reduction of spectrum for Met-Aids requires improvements which greatly increase the operational cost of radiosondes. Radiosondes operation requires separation distance and/or frequency separation from Met-Sat stations to minimize the risk of harmful interference to the Met-Sat. Radiosondes operation are therefore already confined in several countries to the band 1675 - 1690 MHz or less. The goals for frequency spectrum requirements of radiosonde systems achievable by 2010 have been identified

by WMO as 12 MHz in the band 1675 -1700 MHz, use of 1675-1687 MHz being preferred to minimize interference to the Met-Sat.

1.11 In conclusion, as regards the 1 675 - 1 710 MHz band, sharing between the MSS and the Met-Sat would only be feasible, with appropriate conditions, in the 1 675 - 1 690 MHz band, limited to 1675 - 1683 MHz in significant areas of the world. However, radiosonde systems are operated in that part of the band and sharing between the MSS and the Met-Aids is not feasible. Although Met-Aids spectrum requirements can be confined to 12 MHz by the year 2010, any allocation to the Mobile Satellite Service of part of the 1675 - 1690 MHz band would not be compatible with meteorological operations for the foreseeable future in many countries.

137-138 MHz band

1.12 The allocation to the Met-Sat of the band 137 - 138 MHz with primary status should be maintained, to safeguard APT & future LRPT operations. The secondary status of the allocation to the Mobile Satellite Service in part of the band should also be maintained to ensure adequate protection to Met-Sat stations.

2. Upgrade allocation of the Met-Sat in the band 401-403 MHz to the primary status

2.1 WRC-97 will consider and take appropriate action in respect of Resolution 710 adopted by WARC 92, which resolves that the secondary allocation to the Meteorological Satellite and Earth Exploration Satellite (EES) Services in the 401 - 403 MHz band be examined by a competent WRC with the intent of raising the allocation to primary status.

2.2 The Met-Sat and EES Services use the 401 - 403 MHz band to collect data from airborne, land based and maritime data collection platforms (DCPs of the Data Collection System). DCPs are playing an increasing role in meteorological operations in the framework of the World Weather Watch and other WMO programmes (HYCOS). WMO will co-ordinate the frequency use in the 401-403 MHz band between the Met-Aids, Met-Sat and EES Services.

2.3 The upgrade of the EES and Met-Sat frequency allocations to primary in the 401-403 MHz band will ensure continued viable operation of the critical mission objectives of these programs, which are of prime importance for meteorological operations.

3. Frequency requirements for wind profiler radars

3.1 WRC-97 will consider and take appropriate action in respect of Recommendation 621 adopted by WARC 92 on "Implementation of wind profiler radars at frequencies near 50 MHz, 400 MHz and 1 000 MHz". The need for frequency bands in the vicinity of each of the frequencies 50 MHz, 400 MHz, and 1000 MHz to permit full performance capability of wind profiler operations has been expressed by the World Meteorological Organisation. ITU-R studied technical and sharing considerations between wind profiler radars and other services allocated in bands near 50, 400 and 1000 MHz to determine suitable frequencies. ITU-R has adopted Recommendations ITU-R M.1226, ITU-R M.1085-1 and ITU-R M.1227 on technical and operational characteristics of wind profiler radars in bands in the vicinity of 50 MHz, 400 MHz and 1000 MHz, respectively. Sharing possibilities have been identified, however, no single bands near 50 MHz, 400 MHz and 1000 MHz, respectively, are available world-wide.

3.2 Near 50 MHz, the candidate frequency band 40 - 80 MHz is suitable for sharing with other services provided the following conditions are satisfied: wind profiler radar density is relatively low, broadcast station density is relatively low, and sharing arrangements are made with all services operating in these ranges.

3.3 Near 400 MHz, the frequency bands 420 - 435 MHz, 438 - 450 MHz and 470 - 500 MHz are considered as candidate bands. In the case of the 470 - 500 MHz band, sharing arrangements should be made with existing and planned broadcasting services, including digital broadcasting services. It is impossible to identify one of the candidate bands that can be used in all countries, thus, NMSs wishing to operate wind profiler radars need to check their particular national sharing conditions and ensure that suitable allocations are proposed.

3.4 Near 1000 MHz, a single frequency band is preferable for the wind profiler radar in terms of costs. The candidate frequency bands are:

**904 - 928 MHz (in ITU Region 2);
1 270 - 1 295 MHz;
1 300 - 1 375 MHz**

(As frequency increases over 1 300 MHz, performance of the wind profiler radar decreases significantly).

WMO consider wind profiler radars, in particular near 1000 MHz, to be of major significance to meteorol-

ogy, and the 1 270 - 1 295 MHz band appears to be the best worldwide band which is already allocated to Radiolocation Services. Some concern was expressed about the compatibility between wind profiler radars and active spaceborne sensors (Synthetic Aperture Radar - SAR). Studies and operational experience have demonstrated compatibility between terrestrial radars and SARs, and interference to SARs from wind profiler radars is very unlikely, and, should it occurs, of minor consequence.

3.5 The allocation of bands for the operation of wind profiler radars in the vicinity of 50 MHz, 400 MHz and 1000 MHz, preferably worldwide to the largest extent possible, is of importance for the urgently needed development of a cost-effective and viable upper-air composite observing system at global level. The 1 270 - 1 295 MHz band is the best worldwide band in the vicinity of 1000 MHz.

4. Frequency requirements for spaceborne passive remote sensing

18.6 - 18.8 GHz

4.1 Spaceborne passive remote sensor measurements in the 18.6 - 18.8 GHz band are essential because the band has unique characteristics that are important to obtaining measurements of environmental conditions on the Earth's land and ocean surfaces (such as rain, sea ice, snow cover). Sensing of many land and ocean surface phenomena requires simultaneous measurements at several frequencies, and use of this frequency band is needed. The band 18.6 - 18.8 GHz is allocated to the EES (passive) and Space Research (passive) services on a primary basis in ITU Region 2 only, and on a secondary basis in the rest of the world. The Fixed Service and the Fixed-Satellite Service are allocated worldwide on a primary basis, and implementation of planned fixed-satellite networks and future fixed service networks bears the risk of harmful interference to passive sensors. Adoption of appropriate constraints is vital for continued operation of spaceborne passive sensing.

4.2 A common worldwide primary allocation for the Earth Exploration-Satellite (passive) and Space Research (passive) services in the band 18.6 - 18.8 GHz, with appropriate power limit constraints for other services sharing the same band (fixed-satellite and fixed systems), would improve the possibility of obtaining critical environmental measurements on a worldwide basis and ensure satisfactory operation of spaceborne passive remote sensing in this band.

50-71 GHz (oxygen absorption band)

4.3 WRC-97 will consider the "allocation of frequency bands above 50 GHz to the Earth Exploration-Satellite (EES)-passive- Service" and "the existing frequency allocations near 60 GHz and, if necessary, their re-allocation, with a view to protecting the EES (passive) Service systems operating in the unique oxygen absorption frequency range from about 50 GHz to about 70 GHz".

4.4 The oxygen absorption band consisting of several lines near 60 GHz, represents a unique natural resource for remote temperature profile sensing in the atmosphere, not available in any other frequency band. The EES Service operating spaceborne passive remote sensing in this band is highly sensitive to interferences from active sources. ITU-R studies have shown that re-allocations of Fixed, Mobile and Inter-Satellite (non-Geostationary) Services to other bands will be necessary to ensure that the EES Service (passive) can continue to operate satisfactorily in the oxygen absorption band.

4.5 To ensure satisfactory operation of spaceborne passive remote sensing in the oxygen absorption band, it is necessary to have allocations to the Earth Exploration-Satellite EES (passive) and Space Research SR (passive) Services in the frequency bands 50.2 - 50.4 GHz and 52.6 - 59.3 GHz as follows:

- It is necessary to make allocations to the EES (passive) and SR (passive) Services exclusive from Fixed and Mobile Services in the frequency bands 50.2 - 50.4 GHz and 52.6 - 55.78 GHz;
- The additional allocation of the band 59-59.3 GHz to EES (passive) and SR (passive) is required for high altitude temperature measurements in the atmosphere;
- The band 55.78 -59.3 GHz could be shared with Fixed and Mobile Services;
- The present allocation of Inter-Satellite Services in the bands 54.25 - 58.2 GHz and 59-59.3 GHz could be maintained, but only to inter-satellite links between geostationary satellites with an adequate power limit.

Other bands

4.6 Additional frequency bands above 70 GHz are needed to satisfy requirements for data essential to studies of climate and changes to the Earth's environment. Applications that have been identified include measurement of the Earth's surface and cloud param-

eters to be used for water vapour profiling, tridimensional sounding of water vapour in the atmosphere, tridimensional sounding of oxygen from which atmospheric profiles of temperature can be derived and measurement of the amounts of various pollutant gases in the atmosphere. Further work is required to finalize which additional frequency bands are needed and to determine the bandwidths required to perform the passive sensing measurements with a view to appropriate allocations in the near future.

4.7 The allocation of frequency bands above 70 GHz to spaceborne passive remote sensing -EES (passive) and Space Research (passive) Services- should be included in the agenda of the World Radiocommunication Conference in 1999 (WRC-99).

5. Other matters

7 450 - 7 550 and 7 750 - 7 900 MHz band

5.1 The Met-Sat has an allocation in the band 7 450-7 550 MHz (space-to-Earth) which is also allocated to the Fixed-Satellite Service (FSS). This frequency allocation is used by polar-orbiting satellite systems, and frequency sharing with the FSS allocation using geostationary satellite systems has been shown to be difficult.

5.2 A reallocation of the non-geostationary Met-Sat in the band 7 750-7 850 MHz, where the Met-Sat would share frequencies with the Fixed and Mobile Services, would ensure continued viable operation of the polar-orbiting meteorological satellite systems. The allocation to Met-Sat in the band 7 450-7 550 MHz would be maintained for geostationary meteorological satellite systems only.

26 GHz allocation to the Earth Exploration-Satellite EES Service

5.3 There is an existing secondary allocation to the earth exploration-satellite service (space-to-Earth) in the band 25.5 - 27.0 GHz. The upgrade of this allocation to primary will provide a reliable wide-band data transfer capability for foreseeable future requirements in the earth exploration-satellite service of importance for meteorological applications.

Allocations to space-based active sensors

5.4 WRC-97 will consider upgrading to a primary status the allocations to space-based active sensors operating in the earth exploration-satellite and space research services in various bands between 1 and 25 GHz. **Space-based active sensors provide data of importance for several meteorological applications, and primary allocations would ensure their satisfactory operation.**

**LIST OF MEETINGS
OF THE WORLD METEOROLOGICAL ORGANIZATION**

PERIOD SEPTEMBER - DECEMBER 1997

Date	Place	Title of the Meeting
15-19.IX.1997	Toulouse, France	Working Group on Telecommunications/Study Group on Communication Techniques and Protocols
22-26.IX.1997	Copenhagen, Denmark	Global Digital Sea Ice Data Bank Steering Committee and informal session of the CMM Sub-Group on Sea Ice - Sixth session
23-26.IX.1997	Seattle, WA, USA	ASAP Coordinating Committee - Ninth session
29.IX-10.X.1997	Melbourne, Australia	Marine Meteorology Training Course (co-sponsored by WMO)
30.IX.-6.X.1997	Mbane, Swaziland	RA I Tropical Cyclone Committee for the South-West Indian Ocean - Thirteenth session
6-10.X.1997	Niamey, Niger	Training Workshop for Instrument Specialists (Class III and IV) of RA I (in French)
6-10.X.1997	Montreal, Canada	WMO Training Seminar on Environmental Emergency Response Activities for RAs III, IV and V
8-15.X.1997	Pretoria, South Africa	RA I Workshop on Tropical Cyclones
8-17.X.1997	Valparaiso, Chile	Port Meteorological Officer Workshop for Spanish-speaking countries in RA III and RA IV
13-17.X.1997	Montreal, Canada	CBS Advisory Working Group - Twenty-first session
13-17.X.1997	La Réunion	Data Buoy Cooperation Panel - Thirteenth session
20-22.X.1997	La Réunion	ARGOS Joint Tariff Agreement - Seventeenth session
20-25.X.1997	Pretoria, South Africa	Regional Training Seminar, for English speaking countries, on the Use of GDPS and WAWS Products and Presentation of Forecasts to
27-31.X.1997	Geneva, WMO Secretariat	CBS Working Group on Observations - Seventeenth session
10-14.XI.1997	Geneva, WMO Secretariat	CBS Working Group on Data-processing - Ninth session
25.XI-1.XII.1997	Hong Kong, China	ESCAP/WMO Typhoon Committee - Thirtieth session
1-5.XII.1997	Niamey, Niger	RA I Training Seminar on GTS Techniques and Procedures (in French)
November or December 1997 (Date to be decided)	Place to be decided	Implementation Coordination Meeting on the MTN
1-5.XII.1997 (tentative)	Washington, D.C., USA	Expert Meeting on Environmental Emergency Response Activities
16-19.XII.1997	Bangkok, Thailand	International Expert Meeting on the Participation of Women in Meteorology and Hydrology
Second half of 1997 (Date to be decided)	Geneva, WMO Secretariat (tentative)	Expert Meeting on WWW Monitoring

LIST OF MEETINGS OF THE WORLD METEOROLOGICAL ORGANIZATION

MEETINGS SCHEDULED IN 1998

Date	Place	Title of the Meeting
24.II.-2.III.1998	Dhaka, Bangladesh	WMO/ESCAP Panel on Tropical Cyclones - Twenty-fifth session
February 1998 (Date to be decided)	(Place to be decided)	RA V Working Group on the World Weather Watch
March 1998 (Date to be decided)	Geneva, WMO Secretariat	CBS Working Group on Telecommunications
March 1998 (Date to be decided)	Geneva, WMO Secretariat	CBS Working Group on Data Management
4-12.V.1998	Casablanca, Morocco	Commission for Instruments and Methods of Observation - Twelfth session
13-15.V.1998	Casablanca, Morocco	Technical Conference on Instruments and Methods of Observation (TECO-98) and Technical Exhibition
November 1998 (Date to be decided)	(Place to be decided)	Commission for Basic Systems -Extraordinary session
1998 (Date to be decided)	South-East Asia (Place to be decided)	Training Seminar in Aeronautical Meteorology with Emphasis on the Processing, Manipulation and Display of WAFFS Data and
