1.4.2 General responsibilities of Members

In addition to the responsibilities stated explicitly in the *Technical Regulations* (WMO-No. 49), Volume I, Part I, 3.4.1, the following principles shall apply:

- (a) Members shall ensure that their national collecting system for observational reports allows both national and international needs to be met;
- (b) When adopting international and regional telecommunication plans, Members shall ensure that technical characteristics and operational methods are compatible with the regional telecommunication networks.

Note: The contents and schedules of meteorological transmission programmes are published in *Weather Reporting* (WMO-No. 9), Volume C.

2. FUNCTIONS AND RESPONSIBILITIES OF THE METEOROLOGICAL TELECOMMUNICATION CENTRES

- 2.1 The WMCs (as regards telecommunications) and the RTHs shall be responsible for:
- (a) Collecting the bulletins from their associated NMCs and transmitting them in the appropriate form on the MTN, either directly or through the appropriate WMC/RTH;
- (b) Transmitting on the MTN, either directly or through the appropriate RTH, as internationally agreed and in the appropriate form, the processed meteorological information produced by the WMC or RSMC associated with them;
- (c) Relaying selectively on the circuits of the MTN, as agreed, the bulletins which they receive from these circuits and/or from RTHs not situated on the MTN;
- (d) Ensuring the selective distribution of bulletins to the associated NMCs and to the RTHs not situated on the MTN which they serve;
- (e) Before relaying a message issued from their zones of responsibility (as an RTH in a Region and/or as an RTH located on the MTN) on the GTS, checking the parts related to the telecommunications of the message in order to maintain standard telecommunication procedures. The RTH informs the associated centre originating or compiling the message of any correction to be made to the message. The RTH and its associated centres make arrangements for the insertion of the message without telecommunication errors on the GTS. Messages issued from outside the zone of responsibility of an RTH shall not be corrected by the RTH except in case of special arrangements for inserting data into the GTS;
- (f) Establishing data dissemination systems (terrestrial and/or via satellite) as required in accordance with regional plans;
- (g) Carrying out the monitoring of the operation of the GTS of the WWW;
- (h) For WMCs/RTHs on the MTN, maintaining the Catalogue of Meteorological Bulletins as regards bulletins issued from the zone for which they are responsible for the collection, exchange and distribution of data, as given in paragraph 1, Attachment I-3, and also including data from the Antarctica, as appropriate. WMCs/RTHs on the MTN may share their responsibility with the RTHs (not on the MTN) included in their zone of responsibility through regional arrangements.

Note: The plan for monitoring the operation of the WWW is given in Attachment I-5.

2.2 RSMCs not combined with RTHs should ensure distribution of their products by agreement with an appropriate GTS centre or centres.

- 2.3 With regard to telecommunications, the NMCs shall be responsible for:
- (a) Collecting observational data from their own territory or that of one or more Members according to bilateral agreements, as well as observational data from aircraft and ships

ATTACHMENT II-5. DATA DESIGNATORS ${\rm T_1T_2A_1A_2}$ ii IN ABBREVIATED HEADINGS

Table A	:	Data type designator T_1 Matrix Table for $T_2A_1A_2$ ii definitions
Table B1	:	Data type designator T_2 (when $T_1 = A$, C, F, N, S, T, U or W)
Table B2	:	Data type designator T_2 when $T_1 = D$, G, H, X or Y)
Table B3	:	
Table B4	:	Data type designator T_2 (when $T_1 = O$)

- * Priority level: 1 is allocated to service messages.
 - 2 is allocated to data and request messages.
 - 3 is allocated to seismic waveform data ($T_1T_2 = SY$).
 - 4 is allocated to administrative messages.
- ** See paragraph 2.3.2.2 for definition and use.
- *** See paragraph 2.4.2 for definition and use.
- (1) Table B2 or national table.
- (2) To be determined.

Note: CLIMAT TEMP is not recommended for operations. See the *Abridged Final Report with Resolutions and Recommendations of the 2010 Extraordinary Session of the Commission for Basic Systems* (WMO-No. 1070).

Table B1. Data type designator T_2 (when $T_1 = A$, C, F, N, S, T, U or W)

Instructions for the proper application of the data type designators

1. The designators specified in this table should be used to the greatest extent possible to indicate the type of data contained within the body of the bulletin.

2. When the tables does not contain a suitable designator for the data type, an alphabetic designator which is not assigned in the table should be introduced and the WMO Secretariat notified.

3. This table includes only the FM number and code name for an individual code form. The Roman numeral identifying the latest version has been omitted to reduce clutter. In all cases the latest version of a code is implied. Refer to the *Manual on Codes* (WMO-No. 306) for the complete code name (including the version) of any numbered code. In those few instances where a numbered code does not exist, a reference and the common name is given: e.g. [ICAO] (AIREP). An explanatory note may be appended to an individual table if necessary.

4. In the event that no standard format has been established for a particular data type, and where there is a recommended format, that format is given in square brackets under the column labelled Code form (e.g. [TEXT]). This is a character code in free form – International Alphabet No. 2 (Attachment II-1) or International Alphabet No. 5 (Attachment II-2) will be used.

Table B2. Data type designator T_2 (when $T_1 = D$, G, H or Y)

Instructions for the proper application of the data type designators

1. The designator specified in this table should be used to the greatest extent possible to indicate the type of data contained within the text of the bulletin.

2. Where more than one type is contained in the text, the designator for one of the data types should be used.

3. When the table does not contain a suitable designator for the data type, an alphabetic designator which is not assigned in the table should be introduced and the WMO Secretariat notified.

Designator	Data type	Designator	Data type
А	Radar data	Ν	Radiation
В	Cloud	0	Vertical velocity
С	Vorticity	Р	Pressure
D	Thickness (relative topography)	Q	Wet bulb potential temperature
E	Precipitation	R	Relative humidity
G	Divergence	Т	Temperature
Н	Height	U	Eastward wind component
J	Wave height + combinations	V	Northward wind component
К	Swell height + combinations	W	Wind
М	For national use	Z	Not assigned

Table B3. Data type designator T_2 (when $T_1 = I$ or J)

Instructions for the proper application of the data type designators

1. The designators specified in this table should be used to the greatest extent possible to indicate the type of data contained within the body of the BUFR bulletin.

2. Where more than one data type is contained in the bulletin, the designators for only one of the data types should be used.

3. When the table does not contain a suitable designator for the data type, an alphabetic designator which is not assigned in the table should be introduced and the WMO secretariat notified.

Designator	Data type
Ν	Satellite data
0	Oceanographic/limnographic (water property)
Р	Pictorial
S	Surface/sea level
Т	Text (plain language information)
U	Upper-air data
Х	Other data types

Table B4. Data type designator T_2 (when $T_1 = 0$)

Instructions for the proper application of the data type designators

1. The designators specified in this table should be used to the greatest extent possible to indicate the type of data contained within the body of the GRIB bulletin for oceanographic products.

2. Where more than one data type is contained in the bulletin, the designators for only one of the data types should be used.

3. When the table does not contain a suitable designator for the data type, an alphabetic designator which is not assigned in the table should be introduced and the WMO secretariat notified.

Designator	Data type
D	Depth
Е	Ice concentration
F	Ice thickness

J	Wave height + combinations	W	Wind
К	Swell height + combinations	Х	Lifted index
L	Plain language	Y	Observational plotted chart
М	For national use	Z	Not assigned

Table B7. Data type designator T_2 (when $T_1 = L$)

Designator	Data type	GTS priority	Code form name
А	Aviation routine reports ("METAR")	2	
С	Aerodrome Forecast ("TAF") (VT < 12 hours)	3	
Р	Special aviation weather reports ("SPECI")	2	
S	Aviation general warning ("SIGMET")	1	
Т	Aerodrome forecast ("TAF")) (VT \ge 12 hours)	3	
V	Aviation volcanic ash warning ("SIGMET")	1	
Y	Aviation tropical cyclone warning ("SIGMET")	1	

Note: Data that are expressed in extensible markup language (XML) and use data designators of $T_1 = L$ and $T_2 = A$, C, P, S, T, V and Y are using IWXXM (FM-205).

Table C1. Geographical designators A₁A₂ for use in abbreviated headings T₁T₂A₁A₂ii CCCC YYGGgg for bulletins containing meteorological information, excluding ships' weather reports and oceanographic data

Instructions for the proper application of the geographical designators

1. This table is subdivided into two parts: Part I contains geographical designators related to countries or territories in each RTH zone of responsibility for the collection of observational reports (surface and upper-air); Part II contains those for vast areas such as continents, hemispheres, etc.

2. In the case of bulletins containing observational reports (surface and upper-air) from land stations, geographical designators contained in Part II of the table should be used only when no suitable designators are available in Part I of the table.

3. In the case of bulletins containing meteorological information related to aircraft reports, analyses, prognoses, warnings, climatological data, satellite data and also analogue facsimile information, all the geographical designators contained in this table can be used. However, as far as possible, the geographical designator XX should not be used.

4. For the geographical designator in the abbreviated heading of the METNO and WIFMA messages, XX should be used.

5. Geographical designators contained in this table should not be used in the abbreviated heading of bulletins containing ships' weather reports and oceanographic data.

Notes:

- 1. The designations employed and the presentation of the material in this table do not imply the expression of any opinion whatsoever on the part of the World Meteorological Organization concerning the legal status of any country, territory, city or area, or of its authorities, or concerning the delimitation of its frontiers or boundaries.
- 2. For $T_1T_2 = SZ$, A_1A_2 area designator from Table C1 should be used.

Table C2. Geographical designators A_1A_2 for use in abbreviated headings $T_1T_2A_1A_2$ ii CCCC YYGGgg for bulletins containing ships' weather reports and oceanographic data including reports from automatic marine stations

Instructions for the proper application of the geographical designators

1. The first letter A_1 will denote the nature of the ship or automatic marine station:

For ocean weather stations:	W
For mobile ships and other marine stations:	V
For floats $(T_1T_2 = SO)$:	F

2. The second letter A_2 will denote the area from which the reports contained in the bulletins originate.

3. Whenever practicable, separate bulletins should be prepared to avoid the use of the letter X.

Note: For $T_1T_2 = SZ$, A_1A_2 area designators from Table C1 should be used.

Designator	Geographical area
А	Area between 30°N–60°S, 35°W–70°E
В	Area between 90°N–05°N, 70°E–180°E
С	Area between 05°N–60°S, 120°W–35°W
D	Area between 90°N–05°N, 180°W–35°W
E	Area between 05°N–60°S, 70°E–120°W
F	Area between 90°N–30°N, 35°W–70°E
J	Area south of 60°S
X More than one area	

Table C3. Geographical area designator A_1 (when $T_1 = D$, G, H, O, P, Q, T, X or Y) and geographical area designator A_2 (when $T_1 = I$ or J)

Instructions for the proper application of the geographical area designator

1. The designator specified in this table should be used to the greatest extent possible to indicate the geographical area of the data contained within the text of the bulletin.

2. Where the geographical area of the data does not correspond exactly with the designator, the designator for the area most approximating that of the data may be used.

3. When the table does not contain a suitable designator for the geographical area, an alphabetic designator which is not assigned in the table should be introduced and the WMO Secretariat notified.

Designator	Geo	ographical area		Designator	Geog	graphical area
А	0° – 90°W	northern hemisphere		I	0° – 90°W	southern hemisphere
В	90°W –180°	northern hemisphere		J	$90^{\circ}W - 180^{\circ}$	southern hemisphere
С	180° – 90°E	northern hemisphere		К	180° – 90°E	southern hemisphere
D	$90^{\circ}\text{E} - 0^{\circ}$	northern hemisphere		L	$90^{\circ}\text{E} - 0^{\circ}$	southern hemisphere
E	0° – 90°W	tropical belt		Ν	Northern hem	isphere
F	$90^{\circ}W - 180^{\circ}$	tropical belt		S	Southern hem	isphere
G	180° – 90°E	tropical belt		Т	$45^{\circ}W - 180^{\circ}$	northern hemisphere
Н	$90^{\circ}\text{E} - 0^{\circ}$	tropical belt		Х	Global area (a	rea not definable)

Table C4. Reference time designator A_2 (when $T_1 = D, G, H, J, O, P, \text{ or } T$)

Instructions for the proper application of the reference time designators

1. The designators specified in this table should be used to the greatest extent possible to indicate the reference time of data contained within the text of the bulletin.

2. Where the table does not contain a suitable designator for the reference time, an alphabetic designator which is not assigned in the table should be used.

Designator	Reference time	Designator	Reference time
А	Analysis (00 hour)	L	84 hours forecast
В	6 hours forecast	М	96 hours forecast
С	12 hours forecast	Ν	108 hours forecast
D	18 hours forecast	О	120 hours forecast (5 days)
Е	24 hours forecast	Р	132 hours forecast
F	30 hours forecast	Q	144 hours forecast

Н	21 hours forecast	Q	48 hours forecast
I	24 hours forecast		

Table C6. Data type designator A_1 (when $T_1 = I$ or J)

Instructions for the proper application of the data type designators

1. The designators specified in this table should be used to the greatest extent possible to indicate the type of data contained within the body of the BUFR bulletin.

2. Where more than one data type is contained in the bulletin, the designators for only one of the data types should be used.

3. When the table does not contain a suitable designator for the data types, an alphabetic designator which is not assigned in the table should be introduced and the WMO Secretariat notified.

Notes:

1. Content of ISMx, ISIx, ISNx messages corresponds to the content of traditional SYNOP messages SMxx, SIxx, SNxx.

Category/Subcategory = 000/000 identifies SYNOP data from 0100, 0200, 0300, 0400, 0500, 0700, 0800, 1000, 1100, 1300, ... UTC). Thus SNxx in traditional SYNOP corresponds to ISNx in BUFR.

3. Designators A_1 for T_1T_2 already used for satellite data (e.g. IUC, IUR, IUT) are not allocated and reserved for future allocations, pending the allocation of A_1 for $T_1T_2 = IN$ (satellite data).

64	400	01	Primary layer depth

Table D2. Level designator ii (when T₁ = D, G, H, J, P, Q, X or Y)

Instructions for the proper application of level designators

1. The designator specified in this table should be used to the greatest extent possible to indicate the level of the data contained within the text of the bulletin.

2. When data at more than one level are contained in the text, the designator for only one of the levels should be used.

3. When the table does not contain a suitable designator for the level, a designator which is not assigned in the table should be used.

Table D3. Level designator ii (when $T_1T_2 = FA$ or UA)

T_1T_2	Designator ii	Data type	Code form (name)
FA	01–49	Aviation area/advisories	FM 53 (ARFOR) [text]
FA	50–59	GAMET	[TEXT]
FA	60–99	Not assigned	Not assigned
UA	01–59	Routine aircraft reports	ICAO AIREP
UA	60–69	Special aircraft reports, except for volcanic ash	ICAO AIREP
UA	70–79	Special aircraft reports, related to volcanic ash	ICAO AIREP
UA	80–99	Routine aircraft reports	ICAO AIREP

Note: Noting that there is no known use of the series 80–99, these series were allocated to routine aircraft reports up to 1 September 2008. After 1 September 2008, the series are reserved for future use.

Management and allocation of addresses and AS numbers

IP addresses

IP addresses should be acquired or agreed on as per the instructions in Appendix 7 below.

GTS-nominated host/network addresses

Host and subnet IP addresses for use with GTS-nominated Centres should be notified to WMO as described above.

AS numbers

AS numbers for use on the GTS will be coordinated and issued by the WMO Secretariat as required. Centres should direct their requests for AS numbers to WMO as described above.

Publication of addresses and AS numbers

WMO will publish updated lists of addresses and AS numbers in the monthly WWW Newsletter and will also make these lists available in ASCII text form for access by FTP on the WMO Web server and in World Wide Web format at http://www.wmo.int/pages/prog/www/ois/Operational_ Information/RtngCat_en.html.

GTS DATA EXCHANGE METHODS

Introduction

There are three data exchange methods defined for use on the GTS. The first two are for the exchange of traditional GTS messages. The third is for the exchange of other data.

For traditional GTS messages (those with TTAAii CCCC) the two standards are based on:

(a) TCP/IP sockets;

(b) FTP.

Centres are able to choose between these standards by bilateral agreement.

Other data may also be exchanged on the GTS using a separate standard based on FTP.

TCP sockets-based data exchange

The TCP socket standard involves establishing a connection from the sender to the receiver and for GTS messages to be sent preceded by two control fields. The first field contains the message length and the second is a 2-character field indicating message type (binary, alphanumeric or fax). The third field is the actual GTS message contained within a standard GTS SOH/ETX envelope. The receiving centre uses the message length to determine where each incoming message begins and ends.

The GTS TCP socket protocol does not guarantee end-to-end delivery and data may be lost if the link or one of the message switching systems fails.

The complete data structure is illustrated in Figure 6. Note that the message length does not include the length of the first two fields (message length and type). The message length must always be eight characters long and include leading zeroes as required. The message type field should be encoded using ASCII characters BI for binary, AN for alphanumeric and FX for facsimile.

Message length (8 characters)	Message type (2 characters)	SOH	CR	CR	LF	nnn or nnnnn	CR	CR	LF	Heading		CR	CR	LF	ETX	
		←						Mes	sage	e length _						

Message length: length from SOH to ETX (e.g. 00001826 = 1826 bytes) Message type: AN: alphanumeric, BI: binary, FX: facsimile

Figure 6. Message structure for socket exchange applications

The rules for use of TCP/IP socket exchange can be summarized as follows:

- 1. All new connections must start from a new message.
- 2. Each message is preceded by a message length field of eight ASCII characters and a message type field of two ASCII characters.
- 3. Message length is counted from SOH to ETX inclusive and must contain leading zeroes as necessary.
- 4. Message type must be encoded as BI for binary, AN for alphanumeric or FX for facsimile.
- 5. Receiving centres will check synchronization as follows:
 - Check that the first 8 characters are ASCII numeric;
 - Check that the 9th and 10th characters are BI, AN or FX;
 - Check that the 11th character is SOH;
 - Check that the last character is ETX.
- 6. If synchronization is lost the receiver shall break the connection using the following sequence of TCP user primitives:
 - shutdown (to make sure that all data in the TCP send buffer has been transferred);
 - close.

9.

- 7. It is recommended to use separate sockets for ASCII and binary messages, and separate connections for sending and receiving. The sender should always be responsible for establishing the connection.
- 8. Once a connection is established, it should be maintained.
 - If there should be a need to close a socket, the procedure should be as follows:
 - shutdown (to make sure that all data in the TCP send buffer has been transferred);
 close.
- 10. This procedure should also be used when an MSS is being shut down.
- 11. If the receiving side receives a new unexpected connection request on a port for which it has an established socket, the old socket should be closed and the new socket accepted.
- 12. TCP/IP service/port numbers for these connections will be decided by bilateral agreement. The use of reserved ports (1 to 1023) should be avoided. The use of ports above 10000 is recommended.
- 13. To reduce the amount of data lost if an established connection fails, the TCP send and receive buffer sizes can be adjusted. The recommended value for the buffer size is 4KByte, however this value may be agreed on a bilateral basis.
- 14. To enable detection of message loss, the use of the channel sequence number (CSN) is mandatory. When using the CSN to check for missing messages, the WMO request/repeat procedures should be used to recover these. It may be useful to automate this mechanism to avoid delays caused by manual interaction. In order to minimize data loss, it is strongly recommended that Centres implement a 5-character-long CSN in the future.
- 15. The channel sequence number 000 (or 00000 respectively) should indicate an initialization, and should not cause retransmission requests.

FTP procedures and file naming convention

Introduction

File Transfer Protocol (FTP) is a convenient and reliable method for exchanging files, especially large files. The protocol is defined in RFC 959.

The main issues to be considered are:

- 1. Procedures for accumulating messages into files so as to minimize FTP overheads with short messages (applies only to existing message types);
- 2. File naming conventions for existing message types (existing AHL);
- 3. General file naming conventions;
- 4. File renaming;
- 5 Use of directories;
- 6. Account names and passwords;
- 7. FTP sessions;
- 8. Local FTP requirements;
- 9. File compression.

Accumulating messages into files

One of the problems with using FTP to send traditional GTS messages is the overhead if each message is sent in a separate file. To overcome this problem, multiple messages in the standard GTS message envelope should be placed in the same file according to the rules set out below. This method of accumulating multiple messages applies only to messages for which AHLs have been assigned.

Centres have the option of including or deleting the Starting Line and End of Message strings and indicating which option they are using via the format identifier (points 2 and 4 below).

- 1. Each message should be preceded by an 8-octet message length field (8 ASCII characters). The length includes the Starting Line (if present), AHL, text and End of Message (if present).
- 2. Each message should start with the currently defined Starting Line and AHL as shown in Figure 7.
- 3. Messages should be accumulated in files thus:
 - (a) Length indicator, message 1 (8 characters);
 - (b) Format identifier (2 characters);
 - (c) Message 1;
 - (d) Length indicator, message 2 (8 characters);
 - (e) Format identifier (2 characters);
 - (f) Message 2;
 - (g) And so on, until the last message;
 - (h) If necessary, and subject to bilateral agreement, a "dummy" message of zero length may be inserted after the last real message, to assist with end of file detection in certain MSS systems. This requirement does not exist in most cases and need only be implemented where necessary, and agreed between centres.
- 4. Format identifier (2 ASCII characters) has the following values:
 - (a) 00 if Starting Line and End of Message strings present;
 - (b) 01 if Starting Line and End of Message strings absent (not preferred, to be discontinued).
- 5. The sending centre should combine messages in the file for no more than 60 seconds to minimize transmission delays; this limit should be set to a value depending upon the characteristics of the link. However, the file should be sent immediately when a GTS Priority 1 message (as defined in Part II, section 2.11.1 of the present Manual) is added to the file.
- 6. The sending centre should limit the number of messages in a file to a maximum of 100; this limit should be set to a value depending upon the characteristics of the link.
- 7. The format applies regardless of the number of messages, i.e., it applies even if there is only one message in the file.

^{. . . .}

Starting line and end of message present. Message length: length from SOH to ETX (e.g. 00001826 = 1826 bytes)

Message 1 length (8 characters)		CR	CR	LF	Heading	Text	/		Message 2 length (8 characters)	Format identifier 01
Message length										

Option (not preferred, to be discontinued). Starting line and end of message absent. Message length: length from first CR to end of text (e.g. 00001826 = 1826 bytes)

Figure 7. Structure of a typical message in a file

File naming conventions for existing message types (existing AHL)

The file naming convention is:

CCCCNNNNNNN.ext

where:

CCCC is the international four-letter location identifier of the sending Centre, as defined in *Weather Reporting* (WMO-No. 9), Volume C;

NNNNNNN is a sequential number from 1 to 99999999 generated by the sending Centre for each data type determined by ext; 0 is used for (re-) initialization; through bilateral agreement, Centres may use NNNN instead of NNNNNNNN in case of limitation on filename length. ext is

"ua" for urgent alphanumeric information "ub" for urgent binary information "a" for normal alphanumeric information "b" for normal binary information "f" for facsimile information

Note: Where, through bilateral agreement, Centres allow alphanumeric and binary data in the one file, the b or ub extent shall be used.

General file naming conventions

The procedure is based on transmission of file pairs, one file being the information file and the other being the associated metadata file. The concept of file pairs allows the communications function to be implemented independently of data management requirements for structure of metadata, yet provides for the carriage of whatever metadata is required. It is not compulsory to always have a .met file, such as when the information file itself is self-specifying or when a single .met file can describe several information files (for example, as in the case of same data type for different times). There is always, however, a clear relation between the Information File Name and the Metadata File Name, which should only differ from their Extension field and possible wildcards. File names for new message types (no existing AHL) shall follow the following format. It should be noted that file names for existing message types (existing AHL) can also follow the following format.

The File Name format is a predetermined combination of fields, delimited by the _ (underscore) character except for the last two fields, which are delimited by the . (period) character.

Each field can be of variable length, except for the Date/time stamp field which is predetermined.

The order of the fields is mandatory.

The File Name fields are as follows:

pflag_productidentifier_oflag_originator_yyyyMMddhhmmss[_freeformat].type[.compression]

where the mandatory fields are:

pflag is a character or combination of characters indicating how to decode the productidentifier field. At this time, the pflag field has only the following acceptable value:

Table	3.	Accepted	pflag	values
-------	----	----------	-------	--------

pflag	Meaning
Т	The productidentifier field will be decoded as a standard $T_1T_2A_1A_2$ ii data designator. (The WMO standard data designators are given in Attachment II-5.)
A	The productidentifier field will be decoded as a standard Abbreviated Heading, including BBB as appropriate, space characters being discarded, e.g. T ₁ T ₂ A ₁ A ₂ iiCCCCYYGGgg[BBB].
W	WMO Product Identifier
Z	Originating centre's local product identifier
ΤM	The productidentifier field will be decoded as a standard $T_1T_2A_1A_2$ ii data designator (the WMO standard data designators are given in Attachment II-5). The file will contain the metadata corresponding to the related "T" file.
AM	The productidentifier field will be decoded as a standard Abbreviated Heading, including BBB as appropriate, space characters being discarded, e.g. T ₁ T ₂ A ₁ A ₂ iiCCCCYYGGgg[BBB]. The file will contain the metadata corresponding to the related "A" file.
WM	WMO Product Identifier. The file will contain the metadata corresponding to the related "W" file.
ZM	Originating centre's local product identifier. The file will contain the metadata corresponding to the related "Z" file.

productidentifier is a variable length field containing information that describes the nature of the data in the file. The productidentifier field should be decoded according to the pflag.

The WMO Product Identifier to be used with pflag = W shall be decoded as follows:

<location indicator>,<data designator>,<free description>,<International date-timegroup>,<BBB modification header>

The WMO Product Identifier is composed of two parts:

- (a) The "static part" for description of the product;
- (b) The "optional part" to define the time stamp and status of the product (correction, amendment).

The WMO Product Identifier is not case sensitive. These two parts are defined as follows:

Static part: <location indicator>,<data designator>,<free description>

 <location indicator> defines the producer: Country, organization and the production centre; the country shall be represented by the official ISO 3166 standard 2-letter code. Example:
 <gb-metoffice-exeter>. Each field shall be separated by the symbol "-". The ISO 3166 standard 2-letter code xx shall be used for international organizations and shall therefore be the two first characters of the location indicator of international organizations, for example, "xx-eumetsat-darmstadt", "xx-ecmwf-reading".

Note: Although ISO 3166 uses only upper case letters, WMO file names may use either upper or lower case letters for the ISO 2-letter country code and both cases are considered identical when comparing file names.

- <data designator> specifies the type of data with reference to the categories and subcategories defined in Common Table C-13 of the *Manual on Codes* (WMO-No 306), for example, <SYNOP>, <TAF>, <MODEL>, <RADAR>, <SATELLITE>. When the type of data is a composite type, use the sign "+" for concatenation.
- <free description> is determined by the production centre to characterize the product.

Optional part: [,<International date-time group>,<BBB modification header>]

- <International date-time group> is a YYYYMMDDHHMMSS time stamp of the product, full format without substitution characters (only decimal digits). This field is optional because it can be recovered from the file name field: yyyyMMddhhmmss.
- <BBB modification header> is a complementary group with a similar purpose as the current BBB group of AHL.

Note: In order to facilitate the identification of each field of the product identifier, the static part, as well as the optional part if used, shall comprise two symbols "," separating the fields. Each field shall not contain any symbol ",". If a field is empty, no character shall be inserted between the relevant field delimiters "_" or ",".

oflag is a character or combination of characters indicating how to decode the originator field. At this time, the oflag field has only the following acceptable value:

Table 4. Accepted oflag values

oflag	Meaning
С	The originator field will be decoded as a standard CCCC country code

originator is a variable length field containing information that states where the file originated. The originator field should be decoded according to the oflag.

yyyyMMddhhmmss is a fixed length date and time stamp field. The interpretation of this field should be in accordance with the standard rules set for specific data description and types. Therefore it may have various significance, such as date of creation of the file, or date of collection of data. If a particular date and time stamp field is not specified, it should be replaced by a "-" (minus) character. For example: -----311500-- represents a stamp that specifies only the day (31st), hours (15) and minutes (00). If there are no rules for a specific data type, this field should represent the date and time of creation of the file by the originator.

Type is a variable length field that describes the general format type of the file. Although this information could be considered somewhat redundant to the productidentifier field, it is kept as such for industry accepted standard compatibility. It should be noted that the delimiter before the type field is a "." (period). This is to help parse the file name for fields, since the freeformat field could make use of further "_" (underscore) to delimit subfields.

type	Meaning
met	The file is a metadata file pair which describes the content and format of the corresponding information file with the same name
tif	TIFF file
gif	GIF file
png	PNG file
ps	Postscript file
mpg	MPEG file
jpg	JPEG file
txt	text file

Table 5. Accepted type values
