

# Destroyed / Decommissioned Climatological Station

---

- A Climatological station with a long time-series of observations and observations metadata is destroyed or decommissioned. A climate data manager attempts to determine if there are any adjacent quality stations that could be promoted as a climate station. The climate data manager selects all stations within a buffer of five kilometres around the decommissioned station, modified to exclude stations within unsuitable topographic locations and reviews the time-series observations data and observations metadata to assess the potential of the station for preserving the long term climatological record for that area.
